SYLLOGEUS is a publication of the National Museum of Natural Sciences, National Museums of Canada, designed to permit the rapid dissemination of information pertaining to those disciplines and educational functions for which the National Museum of Natural Sciences is responsible. In the interests of making information available quickly, normal pulishing procedures have been abbreviated.

Articles are published in English, in French, or in both languages, and the issues appear at irregular intervals. A complete list of the titles issued since the beginning of the series (1972) and individual copies of this number are available by mail from the National Museum of Natural Sciences, Ottawa, Canada. K1A OM8

La collection SYLLOGEUS, publiée par le Musée national des sciences naturelles, Musées nationaux du Canada, a pour but de diffuser rapidement le résultat des travaux dans les domaines scientifique et éducatif qui sont sous la direction du Musée national des sciences naturelles. Pour assurer la prompte distribution de cette publication, on a abregé les étapes de la rédaction.

Les articles sont publiés en français, en anglais ou dans les deux langues, et ils paraissent irrégulièrement. On peut obtenir par commande postale la liste des titres de tous les articles publiés depuis le debut de la collection (1972) et des copies individuelles de ce numéro, au Musée national des sciences naturelles, Ottawa, Canada. ABSTRACT

An illustrated identification guide is presented for some of the common or distinctive bryophytes occurring in eastern Canada. Only superficial (25-50x) features are utilized for identification of the plants. Included in the guide are 2 hornworts, 79 liverworts and 154 mosses that occur from Newfoundland to southern Manitoba.

Information is given on the life cycle and structure of bryophytes, on collecting and preparing a reference collection, on identification and methods of study and on a few reference books that are available. Keys to the bryophytes are accompanied by illustrations of the superficial characters important for their recognition. The habitat and distribution are listed for each bryophyte. The guide concludes with an illustrated glossary and an index to the bryophytes.

RESUME

Le présent ouvrage est un guide d'identification illustré de certains bryophytes communs ou particuliers de l'est du Canada. Seules les caractéristiques superficielles (25-50x) sont retenues pour l'identification. Le guide décrit 2 anthocéres, 79 hépatiques et 154 mousses qui poussent de Terre-Neuve jusqu'au sud de Manitoba.

Le guide décrit le cycle évolutif et la structure des bryophytes, montre comment constituer et préparer une collection de référence, comment identifier et étudier des spécimens, et mentionne quelques ouvrages spécialisés. Les clés des bryophytes sont accompagnées d'illustrations de leurs caractéristiques superficielles importantes. Le guide précise l'habitat et la distribution de chaque bryophyte et se termine par un glossaire illustré et un index.

ACKNOWLEDGEMENTS

The usefulness of this guide is enhanced by the habit sketches and accompanying drawings of Gilda Bellolio-Trucco. I am grateful to Linda Ley who did the glossary and structure illustrations (Fig. 2) and helped in all aspects of this work, including the final typing of the manuscript. I appreciate the assistance of Paul Cohen, museum volunteer, and Yves Boudreau, COSEP student, both of whom tested the keys. I thank Eleanor Fenton and Bonnie Livingstone for their assistance with the publication of this guide. Dr. W.B. Schofield, University of British Columbia, read the manuscript and I am indebted to him for his useful comments. Finally, I thank Suzanne Chartrand for the French translation of the guide and Dr. M. Poulin and Miss Kathleen Pryer, National Museum of Natural Sciences, National Museums of Canada, for checking the translation.

INTRODUCTION

The purpose of this guide is to acquaint the reader with some of the common or distinctive hornworts (Division Anthocerotophyta), liverworts (Division Hepatophyta) and mosses (Division Bryophyta) that occur in eastern Canada. These plants, collectively called bryophytes, are often abundant in many parts of the country, yet few people are familiar with their names or know how to distinguish one from another. Their small size makes many bryophytes appear alike to the untrained eye but even a casual glance at the illustrations in this guide reveals a vast array of different plants. In fact, there are approximately 550 species of mosses, 200 species of liverworts and 3 species of hornworts in eastern Canada. This guide contains 235 of the most conspicuous bryophytes found from Newfoundland to southern Manitoba, mainly below 50° N latitude.

The guide is intended primarily for the amateur naturalist or student botanist who would like to be able to recognize bryophytes using superficial characters. A dissecting microscope with a 25-50x magnification, available at most universities, is ideal for this purpose. In lieu of this, a 10-20x hand-lens, which may be purchased at university bookstores, museum boutiques or biological supply stores, can be used with some success.

LIFE CYCLE

In order to understand clearly the structure of the bryophytes it is necessary to describe their life cycle. The life cycle of most bryophytes follows a somewhat similar basic pattern, illustrated here using a moss as an example (Fig. 1).

The life cycle begins with the **spore** (Fig. 1: 1). There are generally hundreds to thousands produced by each plant. These small roundish structures, usually only a few micrometers in diameter, have walls that are either smooth or variously sculptured with a network of ridges and processes. After the spore lands in a favourable environment, germination begins and a green, filamentous **protonema** is produced (Fig. 1: 2). The protonema grows to produce a multicellular, branched web that may cover several centimeters

of substratum. There are some bryophytes that have a thalloid protonema instead of a filamentous one. The protonema forms rhizoids to anchor it to the substratum and eventually a small bud (Fig. 1: 3) develops which forms the leafy (Fig. 1: 4-5) or, in the case of the hornworts and some liverworts, the thalloid gametophyte. The gametophyte may be unisexual or bisexual and bear sexual buds or inflorescences (Fig. 1: 6) containing the male sex organs (Fig. 1: 6a), or antheridia (sing., antheridium), the female sex organs (Fig. 1: 6c), or archegonia (sing., archegonium), or both. Sterile, multicellular hairs, paraphyses (sing., paraphysis), are usually intermingled with the sex organs. Each antheridium contains numerous biflagellate sperm cells (Fig. 1: 6b) but there is only a single egg in each archegonium (Fig. 1: 6c). The sperm are released from the antheridia and swim in a film of water to the archegonia containing the egg (Fig. 1: 6c). The fusion of a sperm and an egg results in a progressive division of cells that eventually forms a sporophyte (Fig. 1: 7-13). The sporophyte of most bryophytes consists of a foot, deeply imbedded in the gametophyte to serve as an absorbing organ for water and food needed for its growth, a seta which is a slender stalk of varying length and, at the distal end of the seta, a capsule containing the spores. Frequently a membranous hood, or calyptra (Fig. 1: 11), which is a remnant of the archegonium, sheathes the capsule. In addition to the spores in the capsule, the liverworts have elaters and the hornworts have pseudoelaters, which are hygroscopically active, elongate cells functioning as aids for loosening up the spore mass and dispersing the spores.

Besides sexual reproduction, as described above, many bryophytes also reproduce by asexual or vegetative means. Specialized branches, parts of leaves, or almost any young cell of the bryophytes may have the capacity to produce a new gametophyte. Quite often, special reproductive bodies called gemmae (sing., gemma) are produced in large numbers on the leaves, stems or rhizoids of the gametophyte. Each gemma, after becoming detached from the plant and landing in a favourable environment, is capable of forming a gametophyte and perhaps, eventually, a sporophyte through a series of stages similar to that of the sexually produced spore.

HORNWORTS (ANTHOCEROTOPHYTA)

All hornworts have a small (ca. 2 cm in diameter), flat, nearly circular, irregularly lobed, thallus or gametophyte (Fig. 2: 1). The thallus is dark green and translucent, each cell of which contains a single large chloroplast, in contrast to other bryophytes which have several chloroplasts per cell. Cavities in the gametophyte are sometimes occupied by colonies of the blue-green alga Nostoc and appear as dark spots on the surface of the thallus. The sex organs are not visible because they are sunken in the upper surface of the gametophyte. Unicellular rhizoids are located on the undersurface of the thallus. A long, cylindrical capsule (hence the name hornwort), sometimes up to 3 cm long, contains spores and pseudoelaters. The cylindrical capsule is green and arises from a bulbous base attached to the thallus. It is surrounded by a tubular outgrowth of the thallus called an involucre. The capsule, which is a long-lasting structure that persists until the death of the gametophyte, splits lengthwise at maturity into two valves to release the spores. A slender thread-like, central strand inside the capsule (columella) may also be seen when the valves split apart. Each capsule continues to produce new spores throughout the growing season, shedding them as they mature in the upper part of the capsule.

THALLOID LIVERWORTS (HEPATOPHYTA)

The gametophyte of many thalloid liverworts is more complex than that of the other bryophytes (Fig. 2: 2). The thallus is light green to dark green, occasionally yellowish green, dull, translucent or with a greasy appearance, and the undersurface, especially the margins, is often purplish. The thalli are large, sometimes reaching 1-3 cm wide and 15-20 cm long, flat and variously lobed. They are one (unistratose) to several (multistratose) layers thick. The upper surface often contains pores leading into air chambers and frequently there are diamond-shaped surface markings surrounding the pores. The lower surface of the thallus often bears unicellular rhizoids and sometimes small scales. A costa is present on the thalli of some species, while dark spots of Nostoc colonies are present on others. Minute green gemmae on the thalli margins or in cups or flask-shaped

receptacles on the surface may be present also in some species. The thalli may be unisexual or bisexual with the sex organs variously located on or in the upper or lower surface. Sometimes the antheridia and archegonia are borne on the dorsal surface in specialized stalked receptacles called antheridiophores and archegoniophores, respectively. The sporophyte is often inconspicuous because the capsule is on a short seta and frequently remains hidden in the archegoniophore or it may be entirely imbedded in the thallus. The capsule, containing spores and elaters, opens irregularly or splits into four valves at maturity.

LEAFY LIVERWORTS (HEPATOPHYTA)

The leafy liverworts are much more common than the thalloid ones. Their colour varies, different shades and combinations of green, yellow, red and brown being the most common. The gametophyte is usually about 0.3-0.8 cm wide by 1-5 cm long and is generally prostrate and flattened in habit. It usually possesses two rows of large leaves, one on each side of the stem (Fig. 2: 3), and a third row of small leaves (amphigastria) on the undersurface of the stem. Leaf arrangement may be transverse, incubous, or more commonly, succubous. The leaves are unlobed or varously lobed and divided. Sometimes each lateral leaf is tightly folded, with one lobe remaining smaller than the other (complicate-bilobed). The margins may be entire, toothed, or fringed with hairs (cilia). The leaves lack a costa and are usually of one layer of cells. Unicellular rhizoids are often present, either scattered on the ventral surface of the stem or restricted to specific parts of the stem or leaves. Yellow, brown, green or red gemmae are frequently present, commonly appearing as granules on leaf margins. The plants are unisexual or bisexual. Antheridia are borne on the sides of the stems surrounded by leaves, while the archegonia are commonly produced at the stem apices or sometimes on short lateral branches (Porella and Chiloscyphus) and are frequently surrounded by a leafy sheath, the perianth. The sporophyte usually has a long colourless seta that elevates the brown to black, spherical or cylindrical capsule above the perianth. The capsule contains spores and elaters, and usually opens by four valves. The sporophyte lasts only a short time and soon dries up after releasing the spores, all of which are shed as soon as the capsule matures.

The mosses have the greatest number of species of all the bryophytes and, as a result, present considerable morphological diversity in both the gametophyte and sporophyte. All mosses (Fig. 2: 4) have a leafy gametophyte, either erect or prostrate, but in some the leaves are scarcely evident. The majority are assorted shades of green but some shades of yellow, red and brown are present in many. Some plants, especially those growing on rock in dry habitats, may even be black. The gametophytes are mostly 1-15 cm long but they are known to be much shorter (1 mm) and longer (60 cm). The stems are either simple or branched, with the branches sometimes being so numerous that they give the stems a "feathery" appearance. The leaves are in three to five spiral rows, or rarely in two opposite rows, and usually possess a single or double costa of varying length. They are generally unistratose except in the costa region where many layers of cells occur. Sometimes they are covered with longitudinal flaps or lamellae. The leaf shape varies, with linear, lanceolate and ovate probably being the most common. The leaves of mosses are rarely deeply notched, lobed or dissected like those of the leafy liverworts. However, they can be consistently curved and twisted in various ways and their surfaces may have folds and undulations. The margins can be entire or toothed. The stems of some species, especially those of branched mosses growing prostrate, have numerous, greenish, filamentous structures among the leaves called paraphyllia. Multicellular, reddish brown to whitish rhizoids are nearly always present at the base of the stems, on the surface of the stems growing adjacent to the substratum, or restricted to certain sites on the stems and leaves. Vegetative reproductive bodies, in the form of small, somewhat terete branches or yellowish green gemmae, either in small, leafy cups or on naked stalks, are sometimes evident in a few species treated in this guide. The gametophytes are either unisexual or bisexual. The inflorescences are visible as tiny buds at the apices of stems and short lateral branches or along the sides of stems. The sporophyte is a persistent and long-lived structure, compared to the sporophyte of the liverworts. In most mosses the sporophyte is made up of a slender, elongate seta which terminates in an urn-shaped capsule containing spores. The colour varies, with yellow, brown, orange, red and reddish brown being the most common. Covering the apex of the capsule is a thin, whitish, yellowish or brownish calyptra that is smooth or sometimes hairy. Beneath this is a convex to beaked lid, the operculum, over the mouth of the capsule. A ring of cells beneath the operculum, the annulus, aids in releasing the

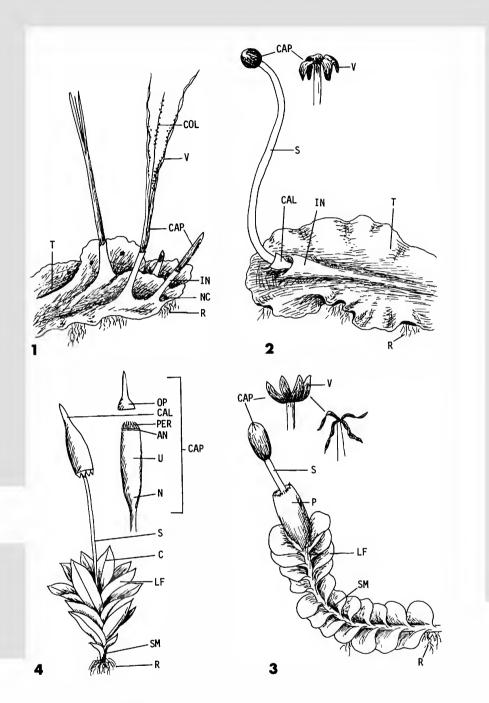

FIGURE 2. Structure of bryophytes. 1. Hornwort. 2. Thalloid liverwort. 3. Leafy liverwort. 4. Moss. (AN - annulus; C - costa; CAL - calyptra; CAP - capsule; COL - columella; IN - involucre; LF - leaf; N - neck; NC - Nostoc colony; OP - operculum; P - perianth; PER - peristome; R - rhizoids; S - seta; SM - stem; T - thallus; U - urn; V - valve).

operculum from the capsule, but usually it is too small to be seen at low magnification. The mouth of the capsule often is ringed by one or two rows of filamentous to lance-shaped teeth, collectively called the **peristome**. The peristome teeth are yellow, brown or red and they are always in some multiple of four, from 4-64, with one or two rows of 16 being the most common. Changes in humidity can cause them to twist or bend and thus assist with spore dispersal. Some mosses have no peristome teeth (e.g., <u>Sphagnum</u>) while others have neither a peristome not an operculum, the capsule opening instead by valves (e.g., <u>Andreaea</u>) somewhat like the liverworts. In most mosses the spores are shed over an extended period, and are extracted from the capsule by movement of the peristome teeth.

The mosses may be conveniently divided into two main groups, according to their growth habit and origin of the sporophyte. The acrocarpous mosses generally have erect, simple or sparsely branched gametophytes that grow in tufts and produce sporophytes at the tip of a stem or main branch. The pleurocarpous mosses usually have prostrate, freely branched gametophytes that grow in mats and produce sporophytes laterally from the main stem.

COLLECTING AND PREPARING A REFERENCE COLLECTION

Bryophytes can be found in a wide variety of moist, shady habitats in eastern Canada. They are water-loving plants because they are so poorly equipped to obtain and retain water and also because they require water for sexual reproduction. For these reasons they commonly grow on forest floors, on boulders in streams and brooks, beside lakes and waterfalls and in dense masses in swamps, fens and bogs. When they do grow in somewhat arid regions they always occur in a microhabitat where they can obtain the maximum amount of moisture. They avoid salt water except for a few species that always occur in the spray zone beside the ocean (e.g., Schistidium maritimum). Most species grow on soil, rock, trees, rotting wood and humus, though occasionally some species grow on such bizarre substrata as animal remains.

A 10-20x hand-lens is essential for field work in order to see the minute detail of the bryophytes. Several plants of each species should be removed from the substratum with the fingers or a knife. Plants containing an excessive amount of water should be squeezed out. Mosses in dense tufts should be divided into small groups so that they will dry faster. Plants bearing mature sporophytes should be collected whenever possible. Both male and female plants should be collected when unisexual species are encountered. Each bryophyte collection is put into a prefolded newspaper packet made from one-half of a page (Fig. 3) and the substratum recorded on the outside of the packet with a felt tip marking pen or some other permanent type of marker that will not smear when wet. The locality is also recorded on each packet, usually with a code number. The locality information, including the province, county or district, distance to nearest town, longitude and latitude, the date and any ecological information, such as exposure, moisture, surrounding vegetation (e.g., beech-maple woods), should be recorded in a field book. All collections from one locality are kept together in a collecting bag (cloth or plastic). Small paper sacks (2 lb.) may be used instead of newspaper packets but the plants often clump-up inside and take longer to dry. Upon returning home or to a field camp the bryophytes should be prepared for rapid drying to prevent the growth of mold and to preserve the colour. The newspaper absorbs much of the moisture from the plants. Any packets that are thoroughly wet or torn should be replaced. Approximately 30-50 packets are then placed in a fish-net bag (cotton decorative netting is the best and least expensive) and hung up to dry. The packets should be tumbled in the bag every few hours to facilitate drying. If a dry indoor room is available, the packets can simply be unfolded and spread out on the floor instead of using the bag method.

After the specimens are dry they are put into permanent packets for a reference collection. Packets are folded from sheets of white paper (21.5 x 28 cm) of good quality (50-100% rag content with 20-24 lb. weight) resulting in a standard size of about 10 x 14.5 cm (Fig. 4). The bryophytes should be further cleaned and trimmed of excess substratum so they will fit into the packet. A smaller packet may be folded for small plants or loose parts and placed inside the standard packet. Each collection is given a separate number. The name of the bryophyte and the collecting data are put on the packet's flap or a separate label slightly smaller than the flap onto which it is to be pasted (Fig. 5). The label should bear the following information: name(s) of bryophyte(s) with author(s), country

(optional), province, county or district, locality (including kilometers to nearest town, longitude and latitude), habitat (including substratum), date collected, collector, collection number, person who identified specimen if different from collector, and year identified. The specimens may then be conveniently stored in shoe boxes for future reference.

IDENTIFICATION AND METHODS OF STUDY

To identify a bryophyte, a dried plant is removed from its packet and revived to its original appearance by soaking it in a small dish of water for a minute or so. A 10-20% solution of household liquid detergent may be used to speed up the wetting process. The

plant may then be examined by placing it on a microscope slide or on a thin piece of clean glass about 8 cm square. A dissecting microscope with magnification up to 25 or 50x and with a transmitted light base is ideal for studying the superficial features of bryophytes. However, if a microscope is not available, a 10-20x hand-lens may be substituted with a certain degree of success. The only other equipment required is two dissecting needles, tweezers and a metric ruler.

Hornworts and liverworts are best observed without being dissected, but mosses often need to have some leaves removed from the stem in order to look for a costa, teeth on the margins, alar cells or other important features. Only leaves from about the middle third of the stem should be removed since they are the most mature and fully developed. Leaves of large mosses may be removed with tweezers by pulling downward and away from the stem apex in order to get the entire leaf with the alar cells intact. The leaves of small mosses are easier to remove by using two dissecting needles. One needle is used to hold the plant down while the other is used to scrape off the leaves, always scraping from the stem apex toward the base.

When it is necessary to remove the operculum of a moss capsule to look at the peristome teeth, a small hole should be made in the capsule wall before soaking the capsule so the water can enter faster. A firmly attached operculum may eventually have to be forced off with dissecting needles and in this case the teeth may remain inside the operculum.

Thalloid liverworts are most easily studied from freshly collected material.

Observations of the nature of the scales, air chambers and colour should be noted for each collection so that this information is available when the specimen is to be determined.

The techniques used to study the leafy liverworts are generally the same as for the mosses. Observations should be made on the most typical leaves of the plant which are near the middle third of the stem. The three types of leaf insertion (the line at which the leaf joins the stem), transverse, succubous and incubous, are important features used to distinguish the genera. When determining the type of leaf insertion it is important to observe the plant from above (i.e., looking down on the dorsal surface) with the stem spex pointing away from the observer. The presence of underleaves and rhizoids will aid in distinguishing the ventral surface.

REFERENCE BOOKS

Listed below are a few illustrated books that the beginner may find useful when identifying bryophytes of eastern Canada.

- Conard, H.S. 1979. How to Know the Mosses and Liverworts. Second edition. Revised by P.L. Redfearn, Jr. 302 pp. Includes hornworts, liverworts and mosses. Available from W.C. Brown Company Publishers, 135 South Locust, Dubuque, Iowa 52001.
- Crum, H.A. 1983. Mosses of the Great Lakes Forest. Third edition.
 417 pp. Intended for identification of mosses of northern
 Michigan but it works well in our region. Available from
 University of Michigan, Ann Arbor, Michigan 48109.
- Ireland, R.R. Moss Flora of the Maritime Provinces. 738 pp.

 Covers the mosses of New Brunswick, Nova Scotia and Prince Edward Island but it can be used to a great extent for the other eastern provinces. Available from McClelland and Stewart Limited, 25 Hollinger Road, Toronto, Ontario M4B 3G2.
- Schuster, R.M. 1977. Boreal Hepaticae, a Manual of the Liverworts of Minnesota and Adjacent Regions. Bryophytorum Bibliotheca 11. 606 pp. (Reprint of the American Midland Naturalist 49(2): 257-684. 1953). Intended for the identification of hornworts and liverworts of eastern United States but it is also good for our region, although some of the names are outdated. Available from J. Cramer, FL-9490 Vaduz, Germany.

The advanced student will find the following books useful:

- Crum, H.A. and L.E. Anderson. 1981. Mosses of Eastern North America. 2 Vols., 1328 pp. Available from Columbia University Press, 136 South Broadway, Irvington-on Hudson, New York 10533.
- Schuster, R.M. 1966-79. The Hepaticae and Anthocerotae of North America

 East of the Hundredth Meridian. 4 Vols. (More to be published).

 Also available from Columbia University Press.

Use of Keys

The keys that follow may be used to determine the name of an unknown bryophyte. In each key there are always two identically numbered or lettered statements. The user should read both statements and select the one that more accurately fits the plant being identified. The leaders to the right of each statement indicate either a name, which is that of the bryophyte or group of bryophytes in the General Key, or another number or letter. If it is a number or letter, proceed to that number or letter and again make a choice, always selecting the statement that better describes the plant being identified. When a name is reached, indicating the identity of the bryophyte, the illustrations should be checked carefully to make certain they match the plant. Immediately following the scientific binomial is the name of the person(s), usually abbreviated, responsible for it. The distribution of each bryophyte is given first for eastern Canada, followed by its occurrence throughout North America. A two-letter abbreviation is used for the geographic localities which are listed near the end of the guide.

One word of caution is necessary. Since many of the 235 bryophytes contained in this guide resemble others from the region that are not included (ca. 520 additional species), it is possible to key out an excluded species to one that is contained in this treatment. Therefore, the identified specimen should be verified by a bryologist whenever possible. Robert R. Ireland is willing to verify specimens as long as he is contacted in advance and as long as large numbers of specimens are not sent.

GENERAL KEY TO THE GROUPS OF BRYOPHYTES

1.	P 1	ants	s thalloid	
	2.	dark caps	ants circular in outline or nearly so, thin, rk-green, without upper surface markings or costa; psules long-cylindrical, lacking a seta, splitting to 2 valves, columella present	Hornworts (Anthocerotophyta (p. 21)
	2.	to o mark nor	ants not usually circular, often thick, light- dark-green, sometimes with upper surface rkings and costa; capsules neither long-cylindrical r splitting into 2 valves, usually with a seta, lumella absent

8. Thalli with small, dark spots (Nostoc colonies within the thallus) scattered along margin; flask-shaped gemmae receptacles often present near thalli apices
8. Thalli lacking dark spots and gemmae receptacles
Thalli large, 2 mm wide or more, lacking hairs on margin
Thalli small, usually less than 2 mm wide, hairs on margin
METZGERIA
A. Thalli with some marginal hairs in groups of two, ventral surface with hairs only on costa; gemmae lacking on margins of thalli
On shaded cliff faces and ledges, occasionally on bases of trees. NF, NB, NS, QUNF to MI, south to GA and TN. 10. Thalli thin and translucent, individual cells often evident, dichotomously branched

11.	Thalli narrow, 1-2 mm wide; plants usually aquatic, submergedRiccia fluitans
	Riccia fluitans L. Fig. 7: 1-2 (Floating Crystalwort)
	Floating just beneath the surface in water of quiet streams or ponds, sometimes stranded on mud when water recedes. QU, ON, MBQU to BC, south throughout most of U.S.
11.	Thalli broad, 3 mm or more in width; plants
	terrestrial <u>Pellia epiphylla</u> (See p. 24)
	12. Thalli sparingly branched, broad, 3 mm or more
	in width
	QU, ON, MBGR to AK, south throughout U.S.
	12. Thalli much branched, narrow, less than 3 mm wide
	RICCARDIA
	A. Thalli 2-3 pinnately branched; occurring
	in calcareous sites
	A. Thalli irregularly branched or sometimes
	bipinnately branched; occurring in noncalcareous sites
	B. Thalli branches usually broadened near
	apexR. latifrons Riccardia latifrons Lindb. Fig. 17: 1 On decaying wood in moist woods or swamps. NF to ONNF to ON, south to FL, AL, TN, MI and WI; in the West from AK to AT, south to CA, ID and WY.
	B. Thalli branches narrowed toward apex

2, Riccardia palmata. 2. Habit (x9).

1.	Leaves divided into filaments or having margins with
1.	many long cilia
•	margins, entire or broadly lobed, sometimes the lobes
	ending in a cilium or the leaf base with a few cilia4
	2. Plants small, stems less than 1 mm wide, irregularly branched, leaves divided to base into 3-4 filamentous
	lobes
	On moist decaying logs, damp, shaded rock faces and
	sometimes on bases of trees. NF to MBGR to AK, south in the mountains and northern states to NC, TN,
	MI, IL, IA, NM, MT, ID and CA.
	2. Plants large, stems usually more than 1 mm wide,
	pinnately branched, leaves divided into 2-5 lobes, the margins ciliate
	margins ciliate
3.	Plants light yellowish- or whitish-green, plumose,
	usually over 1 cm wide, leaves with narrow lobes with branched ciliaTrichocolea tomentella
	Trichocolea tomentella (Ehrh.) Dum. Fig. 18: 3-4 (Woolly Liverwort)
	On rocks, soil and rotten logs, predominantly in cedar
	swamps, but also in rather shady, moist sites, especially
	beside creeks and waterfalls. NF to ONNF to ON, south to FL, TN, AR and WI.
3.	Plants green to reddish- or purplish-brown, usually not plumose, less than 1 cm wide, leaves with broad
	lobes with unbranched cilia
	PTILIDIUM
	A. Leaves divided 1/2 their length into wide
	lobes, the margins with short cilia; plants green to reddish brown
	Ptilidium ciliare (L.) Hampe Fig. 19: 1-3
	On thin soil or humus over exposed rock,
	occasionally in depressions in bogs. NF to MBGR to AK, south throughout Canada and to
	CT, MI, IN, WI and MN; also in MT.
	A. Leaves divided 3/4 or more their length
	into narrow lobes, the margins with long
	cilia; plants green to yellowish brown
	On bark, at bases of trees, on rotting logs and
	on rock. NF to MBNF to AK, south to NC, TN,
	OH, MI, WI, IA, MB, MT, ID and WA.
	4. Leaves complicate-bilobed

5. Leaves with the dorsal lobe smaller than the ventral lobe
6. Leaf lobes narrowly elongate (lingulate), the ventral lobe 2-3 times as long as wide
DIPLOPHYLLUM
A. Leaves with a vitta extending almost to apex
A. Leaves lacking vittaB
B. Leaf apices apiculate
B. Leaf apices obtuse
6. Leaf lobes subcircular to broadly ovate, the ventral lobe 1-2 times as long as wide
SCAPANIA
A. Ventral leaf lobes rounded at apices, the lobes nearly as wide as long
Scapania irrigua (Nees) Gott. et al. Fig. 21: 1-4 In or around standing water in bogs, at margins of lakes and sunny rock pools. NF to MBGR to MB, south to NJ, PA, MI, WI and MN; in the West from AK to YT, south to CA, MT and CO.
B. Ventral leaf lobes distinctly decurrent; leaf margins dentate to spinose-ciliate, rarely entire

· ·	entire to weakly dentate; gemmae lacking
С.	Keel of leaves straight to slightly curved; leaf margins strongly dentate to spinose-ciliate, rarely entire; gemmae often present
	D. Stems usually black at maturity; dorsal leaf lobes not decurrent; leaf margins dentate to strongly serrate, rarely entire; gemmae green to yellowish green
	D. Stems green to dark brown or red at maturity rarely black; dorsal leaf lobes distinctly decurrent; leaf margins spinose-ciliate, sometimes dentate; gemmae cinnamon brown
	Large plants, usually over 1 cm long; ventral leaf lobes about as wide as long; leaf margins entire or nearly so
	F. Keel of leaves straight or slightly curved; gemmae green to yellowish green
G.	Leaf margins coarsely and irregularly serrate

G. Leaf margins entire
H. Leaves dorsally secund, especially when dry, dorsal lobes ca. 1/4 the size of the ventral lobes; gemmae brown to reddish
brownS. gymnostomophila Kaal. Fig. 24: 1-3 A calciphile occurring on wet rocks near water. NF, NS, QU, ONGR to ON, south to MA, NY, MI, WI and MN; in the West from AK to YT, south to BC and ID.
H. Leaves not dorsally secund, dorsal lobes ca. 1/2 the size of the ventral lobes; gemmae green to yellowish green
7. Stems without row of underleaves
7. Stems with row of underleaves8
8. Plants large, stems often over 1 mm wide; underleaves undivided
PORELLA
A. Underleaves narrow, about the same width as stem, margins plane; plants hygrophytic
A. Underleaves broad, wider than the stem, margins reflexed; plants xerophytic
B. Ventral leaf lobes narrower than underleaves, tapering at apex
B. Ventral leaf lobes about as wide as underleaves, broadly rounded at apex

Porella platyphylloidea (Schwein.) Lindb. Fig. 26: 1-3
On bark of deciduous trees, also on shaded
vertical or steep rocks, boulders and cliff
faces. NB, NS, PE, QU, ON--NS to ON, south
to FL, MS and LA; also in TX, NM and AZ.

8. Plants small, stems mostly less than 1 mm wide; underleaves bilobed9
9. Plants reddish brown or dark green; ventral leaf lobes helmet-shaped, attached to stem by slender stalk
FRULLANIA
A. Dorsal leaf lobes with an oblique line of
ocelli
On rocks, cliffs or tree trunks and limbs. NF to ONNF to ON, south to FL, AL, AR and OK.
A. Dorsal leaf lobes without line of ocelli
B. Plants with some erect, nearly naked stem and branch tips due to caducous leaves
B. Plants without erect, naked stem and branch tips
C. Ventral leaf lobes large, more than half the size of the dorsal leaf lobes; dorsal leaf lobes truncate at base
C. Ventral leaf lobes small, scarcely reaching 1/3 the size of the dorsal leaf lobes; dorsal leaf lobes cordate or auriculate at base
D. Underleaves without lateral teeth
D. Underleaves usually with lateral teeth

helmet-shaped nor attached to stem by stalkLejeunea cavifolia Lejeunea cavifolia (Ehrh.) Lindb. emend Buch Fig. 25: 5-6 On shaded rock and bark of trees, rarely on marly soil. NF, NB, NS, QU, ONNF to ON, south in the mountains and northern states to NC, TN, MI, WI and MN.
10. Underleaves present
11. Leaves incubous
12. Leaves entire or retuse at apex
CALYPOGEIA
A. Underleaves distinctly bilobed, the sinus descending 1/3-1/4 their length
A. Underleaves entire or retuse at apexB
B. Leaves narrowly rounded at apex
12. Leaves with 3-4 teeth or lobes
13. Plants large, stems 3-6 mm wide, ventral flagella present; leaves tridentate
13. Plants small, stems 1-2 mm wide, ventral flagella lacking; leaves 3-4 lobed into finger-like segmentsLepidozia reptans

	On humus, decaying wood, peaty soil and soil over rock in moist, deeply shaded woods. NF to MBLB to AK, south to NC, TN, MI, WI, IA, MB, SA, MT, ID and CA; also in NM.
	14. Leaves entire or somewhat retuse at apex
15.	Underleaves bilobed, often with a tooth on the base of the lobes
	CHILOSCYPHUS
	A. Plants whitish green; leaves rounded- truncate to truncate, sometimes retuse at apex; sporophytes frequent
	Chiloscyphus pallescens (Ehrh. ex Hoffm.) Dum. Fig. 31: 1-3 On moist soil, rocks, decaying logs and humus near streams and swamps. NF to ONLB to AK, south to NC, TN, AR, KS, NM, UT, ID and CA.
	A. Plants green to dark green; leaves rounded to rounded-truncate, seldom retuse at apex;
	sporophytes rare
15.	Underleaves entire, lanceolate
	16. Leaves 3-4 lobed
17.	Leaves with deeply channelled lobes, the margins broadly reflexed
17.	Leaves without channelled lobes and reflexed margins
	BARBILOPHOZIA
	A. Leaves mostly 3-lobed, rarely 4-lobed; numerous, erect flagellae arising from stem apices

Lepidozia reptans (L.) Dum. Fig. 30: 4-6

	and MN; in the West from AK to BC, south to WA, MT and CO.
	A. Leaves mostly 4-lobed, rarely 3-lobed; flagellae lacking
	riageriae rackring
	B. Leaves acute to obtuse, never mucronate tipped, lacking cilia; underleaves small
	and indistinct
	logs, mainly in coniferous forests. NF to MBGR to AK, south to NC, TN, MI, WI, MN, MB, SA, NM, MT, ID and WA.
	B. Leaves usually mucronate tipped, the postical leaf base with cilia;
	underleaves large and distinct
	C. Plants green or brownish, leaves flat or
	weakly crisped, middle leaf lobe about as broad as long; reddish brown gemmae often
	present at shoot apices
	Barbilophozia hatcheri (Evans) Loeske Fig. 34: 1-4 Predominantly on acidic cliff faces and ledges,
	sometimes on boulders, in spruce-fir woods. NF,
	NB, NS, QU, ON, MBGR to MB, south to NH, VT,
	NY, MI and MN; also in NC; in the West from AK to YT, south to CA, MT and CO.
	C. Plants whitish or yellowish green, leaves strongly undulate-crispate, middle leaf lobe about twice as broad as long; gemmae lacking
	On acidic cliff faces and ledges, boulders, sometimes on humus over calcareous rock in spruce-fir woods. NF, NB, NS, QU, ON, MBGR
	to MB, south to ME, NH and MI; in the West from AK to YT, south to WA, UT and NM.
rou	ves distant, flat, the lobes obtuse or broadly nded at apex; plants occurring in Sphagnum s or in other acidic, subaquatic habitats
008	Cladopodiella fluitans (Nees) Joerg. Fig. 35: 1-3 In and beside standing pools of water in peat bogs. NF to ONLB to ON, south to NJ, WV, MI and MN; in the West from BC and WA.
	ves mostly close, usually somewhat concave,
occ	lobes acute to narrowly obtuse at apex; plants urring mostly in drier habitats19
	aves entire, attached on one side of base ral leaves
or race	rar reaves narpantnus scutatus

Barbilophozia attenuata (Mart.) Loeske Fig. 33: 1-4

On boulders, cliff faces and ledges and decaying logs and stumps. NF, NB, NS, QU, ON--GR to ON, south in the mountains and northern states to NC, TN, MI, WI

19.

	Harpanthus scutatus (Web. & Mohr) Spruce Fig. 35: 4-6 Often on siliceous rocks, more rarely on moist decayed logs, humus and peaty soil in damp, shaded sites. NF to ONLB to ON, south to NC, TN, MI, IA and MN; in the West from BC and AT.
19.	Underleaves bilobed or ciliate, rarely entire, not attached to lateral leaves
	20. Underleaves bifid nearly to base, the margins without cilia
	usually ciliate, or underleaves entire21
21.	Rhizoids confined to bases of underleaves; underleaves ciliate
	LOPHOCOLEA
	Note - The genus Chiloscyphus has recently been redefined to include Lophocolea. The new names for the two species listed below are Chiloscyphus minor (Nees) Engel & Schust. (for L. minor) and C. profundens (Nees) Engel & Schust. (for L. heterophylla).
	A. Plants small, 0.5-1.0 mm wide, usually sterile, clusters of yellowish green gemmae on margins of leaves
	A. Plants large, 1-2 mm wide, usually fertile and perianths present, gemmae lacking
21.	Rhizoids scattered throughout ventral surface of stems; underleaves sometimes entireLophozia

LOPHOZIA

A. Plants with underleavesB A. Plants lacking underleaves
B. Underleaves ciliate; gemmae lacking
B. Underleaves entire; gemmae usually present, brownish, on leaf margins at tips of gemmiferous shoots
Lophozia heterocolpos (Thed.) M.A. Howe Fig. 37: 4-7 On calcareous rocks or rarely on decaying logs. NF, QU, ONGR to ON, south to ME, NH, VT, MI, WI and MN; in the West from AK to YT, south to CA, ID and MT.
C. Leaf lobes toothedL. incisa Lophozia incisa (Schrad.) Dum. Fig. 38: 1-4 An acidophile, on moist, decaying logs, peaty
banks, humus-covered rocks, or sometimes on
bare, moist rocks. NF to MB—GR to MB, south
in the mountains and northern states to NC, TN, MI, WI and MN; in the West from AK to YT, south to CA, NV and NM.
C. Leaf lobes entire
D. Leaves about as wide long, the sinus broad and shallow; gemmae greenish or yellowish green
D. Leaves much longer than wide, the sinus
narrow and deep; gemmae orange or
reddish brownL. <u>longidens</u> Lophozia longidens (Lindb.) Mac. Fig. 38: 9-12 On acidic rocks, decaying wood and bases of trees. NF, NS, QU, ONGR to ON, south to
CT, NY, MI, WI and MN; in the West from BC to AT, south to OR, ID, MT and CO.
22. Leaves undivided or nearly so
23. Rhizoids purple or violet; leaves wavy or ruffled when dryFossombronia foveolata
Fossombronia foveolata Lindb. Fig. 39: 1-4 On damp, sandy soil at lake margins and beside streams. NS, QU, ONNS to ON, south to NC, TN, MI and WI; in the West from BC to OR.
23. Rhizoids not purple or violet, usually hyaline or
brownish; leaves not wavy or ruffled when dry24

	Plagiochila porelloides (Torrey ex Nees) Lindenb. Fig. 39: 5-6 (Spleenwort Hepatic)
	On moist rocks and shaded, soil-covered banks, rarely on rotten logs, stumps and bases of trees. NF to
	MBGR to MB, south to GA, KY and AR; in the West from AK to SA, south to CA, ID, MT and NM.
	24. Leaves with entire margins (female bracts sometimes ciliate)
25.	Plants green to reddish brown; female bracts ciliate at base; perianth tapered to a ciliate mouth; common, on rotten wood, soil or rocks, never in streamsJamesoniella autumnalis Jamesoniella autumnalis (DC.) Steph. Fig. 40: 1-3 Usually on decaying logs or acidic rocks, sometimes on shaded banks and occasionally on bases of trees. NF to MBNF to AK, south to FL, TN, MS, MO, KS, WY, MT, ID and OR.
25.	Plants green or some plants reddish with a border of enlarged cells; female bracts entire; perianths truncate or tapered, the mouth entire; infrequent, on rotten wood,
	soil or rocks, sometimes in streamsJungermannia
	JUNGERMANNIA
	A. Leaves with a distinct border of large,
	swollen cellsJ. gracillima
	Jungermannia gracillima Sm. Fig. 40: 9-10 On sandy, loamy or clayey banks. NF to ON
	GR to ON, south to FL, AL, MS, WI and IA.
	A. Leaves lacking border of enlarged cellsB
	B. Leaves oblong-oval, often slightly
	retuse at apex; perianth truncate at
	apex; plants mostly in mesic habitats
	On moist rock, on soil over rock, on decaying logs and on peaty ground in boggy areas. NF,
	NS, PE, QU, ON-LB to ON, south to GA, AL, MI,
	WI, MN and KS; in the West from AK and BC, south to CA, ID, MT and UT.
	B. Leaves cordate to nearly rounded, not retuse
	at apex; perianth tapered at apex; plants in aquatic habitats
	Jungermannia exsertifolia ssp. cordifolia (Dum.) Vana Fig. 40: 7-8
	On rocks in or beside silt-free streams. NF, NS,
	QU, ONNF to ON, south to CT, NY, MI and WI; in the West from AK to AT, south to CA, ID and CO.
	,
	26. Leaves 3-4 lobed
	26. Leaves 2 lobed

	Leaf lobes all about the same size
	28. Leaf lobes entire; gemmae reddish brown, sometimes lacking
	TRITOMARIA
	A. Leaves as wide or wider than long; gemmae lacking
	A. Leaves longer than wide; gemmae usually present, reddish brown
	28. Leaf lobes toothed; gemmae green or yellowish green, usually present
29.	Leaves strongly concave and sac-like, each lobe ending in a long, slender cilium; occurring only on rotten wood···································
29.	Leaves neither sac-like nor ending in long cilia; on wood and other substrates
	30. Leaves transverse
31.	Leaves deeply divided, 1/3-1/2 their length; gemmae usually present, reddish or purplish brown
	ANASTROPHYLLUM
	A. Plants small, gemmiferous shoots filiform, 0.5-1.5 mm wide
	A. Plants larger, gemmiferous shoots not filiform, 1.0-2.5 mm wide

Anastrophyllum michauxii (Web.) Buch ex Evans Fig. 42: 7-9
On acidic cliff faces and ledges, sometimes on
decaying logs. NF, NB, NS, QU, ON, MB--LB to MB,
south in the mountains and northern states to NC,
TN, MI, WI and MN; in the West from AK to YT, south
to WA, ID, AT and WY.

31.	Leaves shallowly divided, 1/8-1/3 their length;
	gemmae lacking
	MARSUPELLA
	A. Leaves weakly bilobed, the sinus shallow
	and broad, extending about 1/5 the leaf length,
	dorsal margin distinctly reflexed
	Marsupella emarginata (Ehrh.) Dum. Fig. 43: 1-3
	On moist, acid rocks beside streams. NF to ON-
	GR to ON, south to GA, TN, MI, and MN; in the
	West from AK to YT, south to CA, AT, MT and CO.
	A. Leaves strongly bilobed, the sinus deep
	and narrow, extending about 1/3 the leaf
	length, dorsal margin plane
	Marsupella sphacelata (Gieseke) Dum. Fig. 43: 4-6
	On acidic rocks and cliffs in and along streams,
	sometimes on dry, sunny cliffs. NF, NS, QU,
	ONGR to ON, south to GA and TN; in the West
	from AK to AT, south to CA and ID.
	32. Leaf lobes obtuse to broadly rounded
	32. Leaf lobes acute to acuminate
33.	Leaves somewhat concave, about as broad as long,
	the lobes about equal in size
	Gymnocolea inflata (Huds.) Buch Fig. 44: 1-3
	On humus over wet to moist, acidic rocks and rock outcrops, or
	sometimes in depressions in bogs. NF to MBGR to AK, south
	to NJ, PA, MI, MN, SD, WY, AT and CA; also in NC, TN and AR.
33.	Leaves flat, much longer than broad, the ventral
	lobe larger than the dorsal lobe
	34. Plants small, usually 0.5-1.0 mm wide, stems
	transparent; leaves deeply cleft, the lobes
	often connivent
	CEPHALOZIA
	A. Leaves deeply divided, the sinus extending
	1/2 or more the leaf length, the lobes
	nonconnivent

Cephalozia bicuspidata (L.) Dum. Fig. 44: 4-5
On moist, acid rocks, mineral soil and peaty or
sandy banks beside streams, sometimes on decaying
logs. NF to ON--GR to AK, south to GA, TN, IL, IA,
KS, CO, UT, ID and CA.

34. Plants large, mostly over 1 mm wide, stems opaque; leaves shallowly cleft, without connivent lobes......Lophozia (See p. 46)

1. Plants with 3-several branches in fascicles, the branches crowded near the stem apex to form a tuft; in bogs, swamps, lakes, wet depressions in woods,
or other wet habitatsSphagnum
SPHAGNUM (Peat or Bog Moss)
A. Branches (as seen below stem apex) in fascicles of 6-13
A. Branches (as seen below stem apex) in fascicles of 4-6B
B. Branch leaves squarrose, green or yellowish green
B. Branch leaves not squarrose, usually reddish or purplish
C. Branch leaves cucullate, almost as broad as long
In hummocks in open areas of bogs, sometimes in fens. NF to MBGR to AK, south to FL, KY, IA, TX, ID and CA.
C. Branch leaves not cucullate, longer than broad
1. Plants without branches in fascicles; often in dry habitats2
2. Plants erect, small, stems less than 2 cm high, brown to reddish brown or black, leaves often without a costa; capsules eperistomate, opening most of their length by 4 longitudinal slits when dry; on noncalcareous rock
ANDREAEA
A. Leaves ovate to ovate-lanceolate, ecostate;
commonA. rupestris

	GR to AK, south to GA, MI, MN, CO and northern CA.
	A. Leaves narrowly lanceolate, costate; rare
	2. Plants otherwise; capsules peristomate or eperistomate, opening by an operculum
3.	Plants apparently lacking leaves; capsules large and prominent with a somewhat flattened upper surface, 5-7 mm long, on long, warty setae
3.	Plants with conspicuous leaves; capsules usually smaller4
	4. Leaves in two distinct rows
5.	Leaves broad, often over 1 mm wide, with a flap fused onto the upper surface to form a large sheath
5.	Leaves narrow, less than 1 mm wide, lacking flap
	6. Plants with a large ovoid capsule, lacking seta and immersed among bristle-tipped leaves
	6. Plants usually with a small capsule and a prominent seta, or if lacking seta, capsule not ovoid and plants without bristle-tipped leaves
7.	Plants greenish white, usually 3-6 cm high, in large, rounded, dense cushions on the ground; leaves close, tubuloseLeucobryum glaucum

Andreaea rupestris Hedw. Fig. 47: 1-5 On exposed, acidic boulders and cliffs. NF to MB--

	Leucobryum glaucum (Hedw.) Ångstr. ex Fries Fig. 50: 1-4 (Pin Cushion Moss) On moist soil or humus, frequently on slopes in woods, occasionally in swampy woods or woods beside lakes. NF to MBNF to MB, south to FL, MS, LA and OK.
7.	Plants not greenish white or if so, not in dense cushions and without tubulose leaves8
	 Plants in tufts and cushions, main stems erect, or nearly so, simple or with only a few branches, the branches sometimes short and tuft-like; costae usually prominent, single; sporophytes arising from stem apices or the apices of branches below (acrocarpous mosses)
	often pinnate or rarely simple and if so, the stems long and intertwined; costae often indistinct, single, double or frequently lacking; sporophytes arising from main stem somewhere below apex (pleurocarpous mosses)
9.	Gemmae cups (formed by apical leaves) present at the tips of gemmiferous shoots; capsules cylindric with 4 large peristome teeth; common, usually on rotten wood
9.	Gemmae cups lacking; peristome teeth 16 or more; on various substrata
	10. Leaves with lamellae on upper surface; peristome teeth attached by their tips to a membrane covering the mouth of the capsule
11	Lamellae few, less than 10; leaves undulate, crisped or contorted when dry, costae narrow; calyptrae hispid, not hairy
	ATRICHUM
	A. Leaves broad, usually less than 4 times as long as wide, without teeth on back of lamina (sometimes a few teeth on back of costa)
	A. Leaves narrow, usually more than 5 times as long as wide, with rows of teeth on back of lamina

B. Plants small, stems up to 3 cm high, sparsely leaved, often producing sporophytes; usually in dry habitats in woodlands and along roads
B. Plants large, stems up to 6 cm high, densely leaved, rarely producing sporophytes; mainly in wet habitats, along streams and at margins of swamps
ll. Lamellae numerous, more than 10; leaves rigid, not undulate, scarcely contorted when dry, costae broad; calyptrae hairy
12. Stems simple; leaves sometimes with a reddish or whitish awn; capsules 4-angled
POLYTRICHUM (Hair-Cap Moss)
A. Leaf lamina with entire and infolded margins that cover lamellae
B. Leaves ending in a whitish hair point
C. Stems long, often over 5 cm high, commonly matted with whitish rhizoids; leaves erect-imbricate when dry; plants of bogs
C. Stems short, seldom up to 5 cm, rhizoids scarcely noticeable; leaves spreading; plants of dry habitats

D. Capsules short, about as long as wide
On soil or humus over boulders, stumps and overturned tree roots in woodlands. NF to ON—NF to ON, south to GA, AL, MS, AR and OK; also in NM.
12. Stems simple or sometimes branched; leaves without awn; capsules terete
POGONATUM
A. Plants large, stems 2-9 cm high, branched; on soil over boulders, cliff shelves and in cliff crevices
13. Leaves narrow, often subulate, 10-20 or more times as long as leaf width near middle; costae usually covering most of leaf near middle
14. Leaves squarrose, with an enlarged base clasping the stem; capsules horizontal, strumose; usually on wood

	Alar cells noticeably differentiated, often inflated and red or orange
	16. Leaves short, about 3 mm long, entire; stems short, about 2 cm high, red; capsules rare, short, pyriform; on rock along streams and near waterfalls
	16. Leaves long, mostly more than 3 mm, serrate on margins and back of costa; stems long, nearly always more than 2 cm high, usually green or brown; capsules common, long, cylindric; on rock or various substrata
17.	Costae broad, occupying about 2/3 of leaf at base and nearly all the leaf near the middle; capsules straight, erect; usually on rock
17.	Costae narrow, occupying about 1/3 of leaf at base and usually less above; capsules straight to arcuate, erect or inclined; on various substrata
	DICRANUM
	A. Plants with sporophytes often clustered in the perichaetia
	B. Leaves strongly undulate, glossy, margins strongly toothed in upper half
	B. Leaves smooth or weakly undulate, dull, margins weakly toothed
	C. Capsules straight, erect; 1-6 terete, microphyllous branchlets often present in some leaf axils

	Dicranum flagellare Hedw. Fig. 59: 5-7 Commonly on rotting stumps and logs, rarely on humus or soil over rock. NF to MBLB to BC, south to FL, AL, LA, SD and MT.
	C. Capsules curved, inclined to horizontal; microphyllous branchlets lacking
	D. Leaves often over 6 mm long, strongly serrate on margins and back of costa, scarcely crisped when dry; capsules long, often over 3 mm, nonstrumose
	D. Leaves usually less than 6 mm long, weakly serrate, strongly crisped when dry; capsules short, seldom reaching 3 mm, often strumose
	18. Capsules distinctly narrowed at neck that is nearly as long as the urn (especially noticeable when dry); leaves entire
19.	Capsules cylindric, strumose, erect to somewhat inclined
19.	Capsules pyriform, not strumose, horizontal to pendulous
	20. Leaves with recurved, serrate margins; capsules globose or nearly so

21. Leaves light green, mostly 4 mm long or more, crisped and contorted when dry, base sheathing stem; Bartramia pomiformis Hedw. Fig. 61: 1-4 (Apple Moss) On soil or humus over boulders, on cliff ledges or in crevices, often along streams. NF to MB--GR to AK, south to GA, AL, AR, OK, MT and OR. 21. Leaves dark green to yellowish green, seldom reaching 4 mm in length, weakly contorted when dry, base not sheathing stem; frequent, on Plagiopus oederiana (Brid.) Limpr. Fig. 61: 5-8 On calcareous cliffs and boulders, especially along streams. NF to ON--GR to AK, south to VA, IN, IA, CO, ID and OR. 22. Leaves with a V-shaped region of hyaline cells at base, dorsal surface with a dull lamina and a distinctly shiny costa, many leaves with broken tips and missing portions.......Tortella TORTELLA Tortella fragilis (Drumm.) Limpr. Fig. 62: 1-2 On calcareous soil or rock, often on cliff ledges or in crevices. NF to MB--GR to AK, south to NJ, NC, TN, IA, NE, CO, ID and OR. A. Leaves usually intact...... <u>T</u>. <u>tortuosa</u> Tortella tortuosa (Hedw.) Limpr. Fig. 62: 3-6 A calciphile usually on cliffs, rock outcrops and boulders, rarely on soil over rotten stumps. NF to MB--GR to AK, south to NC, TN, MI, IL, IA, SD, CO, UT, ID and OR. 22. Leaves lacking V-shaped region of cells and 23. Peristome teeth filiform, capsules not contracted DITRICHUM A. Stems usually tomentose, often over 1 cm high; leaves 2-7 mm long; sporophytes rarely produced; Ditrichum flexicaule (Schwaegr.) Hampe Fig. 63: 1-3 On calcareous soil or rock, especially on bluffs, cliff shelves or in cliff crevices. NF to MB--GR to AK, south to NS, VT, MI, MN, IA, CO, ID and WA.

A. Stems not tomentose, seldom reaching 1 cm high; leaves 1-2 mm long; sporophytes common; on acidic soil banks
Peristome teeth lanceolate, capsules usually contracted under mouth when dry
DICRANELLA
A. Capsules strongly contracted under a portion of mouth when dry; setae yellow to brown
A. Capsules scaracely contracted under mouth when dry; setae red
24. Alar cells strongly differentiated, inflated often red or orange
Leaves entire or nearly so at apex
26. Leaves with a differentiated marginal border of a lighter colour and often thickness than the lamina
Leaves lanceolate to ovate or oblong-lanceolate, seldom more than 1 mm wide, acute to acuminate, often with a long-excurrent costa
BRYUM
A. Plants silvery-white, stems short, 0.4-1.0 cm high, leaves nondecurrent, costae ending below apices

A. Plants green or sometimes brownish or reddish, stems long, 2-6 cm high, leaves long-decurrent, costae percurrent to	
short-excurrent	
MBGR to AK, south to FL, AL, AR, OK, CO, AZ and CA.	
27. Leaves obovate to rounded ovate, usually more than 1 mm wide, costa ending below apex or in a short,	
blunt mucro	hizomnium
RHIZOMNIUM	
A. Plants large, stems often over 5 cm high	
and leaves 5-11 mm long; costae often percurrent; rhizoids scattered along lower	
part of stems	lachianum
Rhizomnium appalachianum Kop. Fig. 66: 1-2	
On wet soil or humus, primarily in swampy forests but often on stream banks and margins of lakes.	
NF to MBLB to MB, south to GA, TN, MI, WI and MN.	
A. Plants small, stems seldom reaching 5 cm	
high and leaves 3-6 mm long; costae subpercurrent; rhizoids restricted to	
leaf axils in lower part of stems	punctatum
Rhizomnium punctatum (Hedw.) Kop. Fig. 66: 3-5	
On soil, humus, rotten logs and stumps, bases	
of trees, boulders and cliffs, in woodlands often beside creeks. NF to ONNF to ON,	
south to GA, TN and AR; also in BC.	
28. Plants on tree trunks, often in small rounded tufts, rarely on fallen trees or rotting logs	20
28. Plants on soil, rock, humus, sometimes at bases of	••••••
trees and over rotting logs but not on tree trunks	30
29. Leaves obtuse, margins plane; capsules immersed <u>Orthotrichum obt</u>	usifolium
Orthotrichum obtusifolium Brid. Fig. 67: 4-7 Usually on deciduous tree trunks, especially elm, maple,	
poplar and willow, rarely on coniferous trunks. NF to MB	
LB to AK, south to NC, TN, MI, MN, NM and CA.	
29. Leaves acute, margins recurved; capsules exserted	<u>Ulota</u>
ULOTA	
A. Plants with leaves strongly crisped when dry; occurring on tree trunks and limbs	U. crispa
Ulota crispa (Hedw.) Brid. Fig. 68: 1-4	
On tree trunks and limbs. NF to MBNF to SA, south to GA, AL, IL and MN.	

twisted but not crisped when dry; occurring on tree trunks and limbs or rock
B. Plants on tree trunks and limbs; capsules pyriform, with a small, puckered mouth when dry
ON, south to GA, NC and TN.
B. Plants on rock; capsules cylindric, without a puckered mouth
30. Leaves obtuse (at least the leaves near the stem tips) to broadly acute
Capsules exserted above leaves on a long seta; peristome teeth filamentous, long and twisted; on soil
Capsules immersed on a short seta; peristome teeth lanceolate, short and not twisted; on rock in or beside ocean
SCHISTIDIUM
A. Leaves ovate-lanceolate, acute or acuminate, rarely narrowly obtuse, often with a hyaline mucro or awn
A. Leaves ligulate to linear-lanceolate, narrowly obtuse to broadly acute, lacking hyaline tip
B. Leaves usually with a long awn, 1/4 the length of leaf or more, dorsal surface of costa often rough near apex
B. Leaves lacking awn or awn very short, dorsal surface of costa smooth

A. Plants with leaves straight, curved or

	C. Leaf apices narrowly obtuse, sometimes acute, leaves not eroded; maritime plants growing on rocks in the spray zone
	C. Leaf apices broadly obtuse to broadly acute, the leaves often eroded; plants not maritime, on rocks in or by streams and lakes
	32. Plants nearly julaceous, mostly silvery-white due to an absence of chlorophyll in cells
33.	Leaf margins inrolled when dry
33.	NF to MBNF to AK, south to FL, LA, TX, AZ, NM and CA. Leaf margins recurved or plane when dry
	34. Capsules inclined to pendulous, sulcate, ribbed or wrinkled when dry
35.	Leafy plants bulbiform; setae flexuose; capsules pyriform
35.	Leafy plants not bulbiform; setae straight or nearly so; capsules cylindric
	36. Leaves green, with some red or purple colouration near the base; pseudopodia lacking; capsules and setae red or purple
	36. Leaves yellowish green, without red or purple colour; pseudopodia often present with gemmae attached; capsules and setae yellow or brown, sometimes reddish brown

AULACOMNIUM

	A. Medium-sized to robust plants, stems 3-9 cm high; pseudopodia present on some plants, bearing elongated clusters of leaf-like gemmae at apices, often with only naked pseudopodia after gemmae have fallen
	A. Small plants, stems 1-4 cm high; pseudopodia with round clusters of gemmae at apices present on some plants
37. 37.	Leaves mucronate, the mucro often yellowish
	38. Leaf margins recurved
	38. Leaf margins plane39
39.	Capsules obovate, opercula oblique, calyptrae cucullate, peristome absent; plants on soil, often in open, weedy habitats, such as roadsides, lawns, gardens, fields and pastures
39.	Capsules cylindric, opercula straight, calyptrae mitrate, peristome present; plants on rock, usually in woodlands
	40. Leaf apices sometimes blunt; capsules with 16 ribs, 8 long ones alternating with 8 short ones; occurring on calcareous rock

	south to NC, OH, IL, IA, SD, NM, AZ and BC.
	40. Leaf apices acute; capsules with 8 ribs of about the same length; occurring on noncalcareous rock
41. 41.	Capsules globose, subglobose or pyriform
	42. Plants large, 3-8 cm high; capsules inclined, ribbed when dry, peristome present
	42. Plants small, less than 3 cm high; capsules erect, smooth or wrinkled at base when dry, peristome lacking
	Leaves with a differentiated border, the border of a lighter colour and often thicker than the lamina
	44. Leaves with hyaline, irregularly toothed border in upper part of leaf
45.	Leaves crowded at stem apices forming rosettes; plants connected by subterranean stems
45.	Leaves not crowded into rosettes and plants not connected by subterranean stems
	46. Leaf borders with teeth in pairs; costae red, especially near base of leaves; stoloniferous shoots absent
	MNIUM
	A. Leaf margins without differentiated border of cells, singly serrate or a few teeth in pairs

Orthotrichum anomalum Hedw. Fig. 67: 1-3
Commonly on calcareous rocks. NF to MB--LB to AK,

Mnium stellare Hedw. Fig. 76: 1-3 On soil over rock, sometimes limestone, on banks and on bases of trees. NF, NB, NS, QU, ONNF to ON, south to NC, TN and AR.
A. Leaf margins with differentiated border of cells, doubly serrateB
B. Costae toothed above on dorsal surface
B. Costae smooth on dorsal surface
C. Leaves scarcely reaching 1.5 mm wide; plants seldom with sporophytes; peristome teeth yellow to light brown
C. Leaves often over 1.5 mm wide and up to 3 mm wide; plants usually with sporophytes; peristome teeth red to purplish brown
46. Leaf borders with single teeth; costae yellow or green; stoloniferous shoots present
PLAGIOMNIUM
A. Leaves obovate, margins toothed to middle
A. Leaves elliptic, margins toothed nearly to base
B. Plants with sporophytes solitary in the perichaetia; occurring in moderately dry habitats
B. Plants with sporophytes clustered (1-4) in the perichaetia; occurring in swampy or wet habitats

Plagiomnium medium (B.S.G.) Kop. Fig. 79: 5-7 On soil, humus, rocks, often in wet depressions in woods. NF to MB--GR to AK, south to TN, AR, CO, AZ and CA.

47. Leaves broad, often over 3 mm wide
47. Leaves narrow, less than 3 mm wide48
48. Leaves ending in a long hyaline point or awn; capsules cylindric, erect, immersed or exserted
49. Hyaline points long, often reaching 1 mm or more; peristome with a basal tube and twisted teeth above
49. Hyaline points short, usually less than 1 mm or if longer, the margins toothed below the point; peristome without basal tube and teeth not twisted
50. Plants with short, tuft-like branches; capsules exserted
RHACOMITRIUM
A. Leaves with an obtuse, nonhyaline apex
A. Leaves with an acute, hyaline apex
B. Hyaline leaf apices entire or indistinctly toothed; plants yellowish green above, dark green to brown or black below
B. Hyaline leaf apices distinctly toothed; plants yellowish green to grayish green above, light brown to blackish below

	C. Hyaline leaf apices extending down margins as decurrencies, strongly toothed; plants grayish green
	Rhacomitrium lanuginosum (Hedw.) Brid. Fig. 81: 1-3 (Woolly Fringe Moss) On dry, exposed, acidic soil or rock. NF, NS, QU, ON, MBGR to AK, south to NH, NY, MT, ID and CA.
	C. Hyaline leaf apices not extending down margins as decurrencies, weakly toothed; plants yellowish green to light brown
	50. Plants with unbranched stems or with long branches; capsules immersed
51.	Plants with a whitish, filamentous or cobwebby substance on leaves
51.	Plants lacking whitish substance on leaves52
	52. Leaf margins recurved
53. 53.	Capsules smooth or indistinctly wrinkled
	54. Leaves often reddish or purplish, especially at base; pseudopodia lacking; capsules and setae purplish
55.	Gametophytes large, often over 1 cm high, leaves broad, 0.5 mm or more wide; on rock in or beside
55.	streams
	Bryoerythrophyllum recurvirostrum (Tayl.) Chen Fig. 83: 6-8 Commonly on calcareous soil over boulders and cliff ledges, sometimes on rotten logs and stumps. NF, NB, NS, QU, ON-GR to AK, south to NJ, NC, MI, AR, TX, NM, AZ and CA.
	56. Stems and costae red, leaves bluish-green

57.	Leaves often 5 mm long or more, margins inrolled when dry; calyptrae remaining attached to setae
	just below capsule
	Timmia megapolitana Hedw. Fig. 84: 1-3
	On moist soil or humus, on shaded banks along creeks or
	in swamps. NS, QU, ON, MBNS to AK, south to VA, MI, IL, AR, KS, SA, AT and BC.
57.	Leaves less than 5 mm long, margins plane; calyptrae
	not remaining attached to setae
	POHLIA
	A. Plants yellowish green to dark green;
	leaf margins recurved; capsules elongate
	On soil, humus, rotten logs and stumps in clearings
	in woodlands, sometimes in bogs. NF to MBGR to
	AK, south to GA, AR, KS, CO, AZ and CA.
	A. Plants whitish green; leaf margins plane; capsules
	elongate or short and nearly as broad as longB
	B. Leaves glossy, often with opalescent
	patches; capsules elongate
	Pohlia cruda (Hedw.) Lindb. Fig. 85: 1-3
	On soil or humus, often on shaded rock ledges or in crevices of cliffs, sometimes on rotten logs. NF
	to MBGR to AK, south to TN, MI, IA, CO, AZ and CA.
	B. Leaves dull, lacking opalescent patches;
	capsules short, nearly as broad as long
	Pohlia wahlenbergii (Web. & Mohr) Andr. Fig. 85: 4-6 On soil in exposed and disturbed habitats,
	sometimes beside streams. NF to MBGR to
	AK, south to NC, TN, AR, NE, NM, AZ and CA.
	58. Leaves strongly rugose when dry, falcate-secund, margins recurvedRhytidium rugosum
	Rhytidium rugosum (Hedw.) Kindb. Fig. 86: 1-3
	On dry, exposed, calcareous rocks and cliffs. NF, NS, QU, ON, MBGR to AK, south to NC, TN, MO, SD, CO and AZ.
	58. Leaves not rugose
	oo. Leaves not rugose
59.	Plants complanate, leaves appearing distichous,
	oblong, falcate, apices rounded
	Homalia trichomanoides (Hedw.) B.S.G. Fig. 86: 4-6 On calcareous rock ledges, bluffs, shaded faces of cliffs'
	and occasionally on bases of trees. NF to ONLB to ON,
	south to NC, MS and AR; also in BC, WA, OR and AZ.
59.	Plants not complanate or if so, leaves not oblong
	with rounded apices
	60. Leaves with a single costa
	60. Leaves lacking costa or costa double (usually
	divided at base)84

	Plants dendroid and erect
	62. Branches covered with paraphyllia that give them a whitish or brownish cobwebby appearance; plants on humus in wet, often swampy habitats
	62. Branches lacking paraphyllia; plants on rock and not in swampy habitats
63.	Apices of many branches with clusters of microphyllous branchlets
63.	Apices of branches lacking clusters of microphyllous branchlets
	64. Stems pinnate to tripinnately branched, sometimes frondose; stems and branches covered with paraphyllia (white, green, yellow or brown in colour with a hairy, granular or cobwebby appearance)
65.	Stems 1-pinnate, with a cobwebby apearance caused by a dense covering of long paraphyllia; plants of wet habitats, especially swampy cedar woods
65.	Stems 1-3 pinnate, with a hairy or granular appearance due to short paraphyllia; plants often in dry habitats
	THUIDIUM (Fern Moss)
	A. Plants 1-pinnate
	A. Plants 2- or 3-pinnateB

	stem when dry; usually on calcareous substrata
	B. Stem leaves appressed or slightly spreading from stem when dry; usually on acidic substrata
	66. Margins of stem and branch leaves ciliate
	66. Margins of stem and branch leaves not ciliate
67.	Stems much branched, covered with a mat of brown rhizoids that are lacking on branches; plants of calcareous swamps and fens
67.	Stems irregularly branched or if subpinnately branched, with few or no rhizoids; plants of various habitats
	68. Leaves squarrose
	68. Leaves not squarrose69
69. 69.	Stem leaves with an obtuse apex, often broad and entire
	70. Plants of wet habitats (bogs, swamps, fens, etc.)
	CALLIERGON
	A. Leaves appressed throughout the stems; costae reaching 3/4 the length of the leaves

B. Stem leaves arched and standing out from

	A. Leaves spreading or often appressed only at stem and branch apices; costae percurrent or ending just below apices
	B. Stems irregularly branched with few branches; stem leaves narrow, clearly longer than broad
	B. Stems often pinnate with numerous branches; stem leaves broad, sometimes nearly as broad as long
	70. Plants of dry habitats, always on limestoneAnomodon viticulosus (See p. 100)
	Leaves strongly falcate-secund, especially at stem and branch tips
	72. Leaves short, seldom over 1 mm long <u>Brachythecium velutinum</u> (See p. 101) 72. Leaves long, mostly over 1 mm long
73.	Leaves acute to short-acuminate, some narrowly obtuse, smooth; perichaetial leaves long and sheathing, nearly reaching capsule; on bases of trees, shrubs and rocks beside streams
73.	Leaves long-acuminate; stem leaves sometimes plicate; perichaetial leaves short and not sheathing setae; often in swamps, fens and bogs or sometimes in woodlands on rock, wood or humus
	DREPANOCLADUS (Hooked Moss)
	A. Stem and usually branch leaves plicate; plants green or yellowish green

	often tinged with red or purpleB
	B. Costae extending 3/4 or more the length of the leaves
	B. Costae extending to middle of leaves, rarely beyond
	74. Plants on rock, usually in streams
75.	Stems often with a wiry appearance, the basal part of the stem with only the remnants of costae attached; leaves narrow, less than 1 mm wide
75.	Stems without wiry appearance, the entire leaves intact; leaves broad, often 1 mm wide
	76. Leaves with a differentiated marginal border of a different colour and thickness than the rest of the leaf
	76. Leaves without differentiated marginal border
	Leaves decurrent
	78. Leaves long in relation to width, 7-15 times as long as wide; plants usually in aquatic habitats, such as swamps, creeks and riversLeptodictyum riparium Leptodictyum riparium (Hedw.) Warnst. Fig. 101: 5-8 On rocks and boulders (sometimes calcareous) in and beside creeks and rivers; also on fallen branches and woody debris in swamps and stagnant pools. NF to MBLB to YT, south to FL, LA, TX, NM, AZ and CA.

A. Stem and branch leaves smooth; plants

	than 7 times as long as wide; plants mostly of
	dry or mesic habitats79
79.	Leaves dull when dry, costa bulging on dorsal leaf surface and of a different colour than lamina80
70	Leaves glossy when dry, costa similar in colour
13.	to lamina82
	80. Leaves acute to nearly obtuse
	periodically flooded places. NB, NS, QU, ON, MB NS to MB, south to NC, AL, MS, LA and NE; also in BC.
	No to Mb, South to No, AL, Mb, LA and ME, also in Bo.
	80. Leaves ending in an apiculus or a long, hyaline hair point
	nair point
81.	Leaves (at least many) with a long, hyaline, often
81.	toothed apex
	point
	ANOMODON
	A. Leaves with a long-filiform, hyaline
	Anomodon rostratus (Hedw.) Schimp. Fig. 94: 4-6
	On rocks and in cliff crevices that are frequently calcareous, on bases of trees and
	sometimes on soil and humus. NF, NB, NS, QU,
	ON, MBNF to SA, south to FL, LA, TX, NM and AZ.
	A. Leaves apiculate, acute or obtuse; leaf margins plane
	margine plane
	B. Plants with attenuate branches (especially
	noticeable when dry); branch leaves gradually
	narrowed to an acute apex, scarcely contorted
	when dry; occurring on tree trunks and calcareous and noncalcareous rock
	Anomodon attenuatus (Hedw.) Hüb. Fig. 95: 1-5
	On tree trunks, bases of trees, rotten stumps
	and calcareous and noncalcareous rocks and
	cliff shelves. NF to MBNF to MB, south to FL, LA, TX, NM and AZ.
	B. Plants without attenuate branches; branch
	leaves obtuse or apiculate, strongly contorted
	when dry; occuring on calcareous rock
	On calcareous rocks and cliff ledges, rarely on tree trunks. NB, NS, ON, QUNS to ON,
	south NY, TN and AR.
	82. Branch leaves broad at apex, acute to narrowly
	obtuse, strongly serrate, not twistedEurhynchium pulchellum

	Eurhynchium pulchellum (Hedw.) Jenn. Fig. 102: 5-9 On soil, rotten stumps and logs, bases of trees, rock outcrops and on humus over rock. NF to MB GR to AK, south to GA, LA, TX, NM, AZ and CA.
	82. Branch leaves narrow at apex, acute to acuminate, sometimes twisted83
83.	Stem leaves smooth, nearly as broad as long, apex often abruptly narrowed, acute and twisted
83.	Stem leaves often plicate, usually longer than broad, apex usually gradually narrowed, acuminate, straight or sometimes twisted
	BRACHYTHECIUM
	A. Plants small, leaves seldom reaching 1.5 mm long; setae rough
	B. Leaves falcate-secund; stem leaves short- decurrent, margins plane or recurved at base
	B. Leaves straight or nearly so; stem leaves long-decurrent, margins recurved to leaf middle or above
	C. Leaves smooth or plicate, stem leaves long- decurrent; setae rough; occurring in wet habitats in and beside creeks, rivers, springs, etc
	C. Leaves plicate, stem leaves short-decurrent; setae smooth; occurring in dry to mesic habitats

	stems long, often 10 cm or more in length
	FONTINALIS
	(Water Moss)
	A. Leaves keeled; plants often yellowish to
	brownish green
	Fontinalis antipyretica Hedw. Fig. 103: 6-8 On boulders and twigs in creeks and ponds.
	NF, NB, NS, QU, ON, MBGR to AK, south to
	PA, MI, WI, MN, NM, AZ and CA.
	A. Leaves concave; plants usually green to brownish
	B. Leaves broad, 2-3 times as long as wide, the margins plane when dry
	Fontinalis novae-angliae Sull. Fig. 104: 1-3
	On rocks in flowing water in creeks and
	rivers or at margins of lakes. NF, NB, NS, QU , QV
	qo, on, no no observe to 12, m and one
	B. Leaves narrow, 3-5 times as long as wide,
	the margins sometimes reflexed when dry
	On rocks, branches and logs in running water
	of creeks and rivers. NF, NB, NS, QU, ON,
	MBGR to AT, south to FL, TN, WI and MN.
	84. Plants not aquatic
85	Leaves with whitish tips, those surrounding immersed
	capsules with cilia on margins; eperistomate; on
	noncalcareous rock
	Hedwigia ciliata (Hedw.) P. Beauv. Fig. 105: 1-4
	On dry, exposed, usually acidic boulders and cliffs. NF, NB, NS, QU, ON, MBGR to AK, south throughout most of
	the United States.
85.	Leaves lacking whitish tips and cilia; peristomate;
	on various substrates
	86. Stems and branches with clusters of
	microphyllous branchlets in leaf axils87
	86. Stems and branches lacking clusters of
	microphyllous branchlets in leaf axils89
0.7	
5/•	Leaves distant, wide-spreading, stems and branches often visible between leaves; on soil or rock
	Isopterygium elegans (Brid.) Lindb. Fig. 105: 5-8
	On soil and humus on banks and cliffs in moist
	woodlands. NF to ONLB to ON, south to SC, GA , TN and AR ; in the West from AK to BC , south to CA .
	IN and AN, In the west from AN to BC, South to CA.
87 .	Leaves close, erect, stems and branches not visible
	between leaves

84. Plants aquatic, in flowing water of streams;

	88. Leaves smooth, branches straight when dry;
	often with sporophytes
	On tree trunks, rotten logs and stumps. NF to MBNF to MB, south to FL, AL, LA and OK; also in BC, AT and SA.
	88. Leaves plicate, branches curved when dry;
	never with sporophytesLeucodon brachypus var. andrewsianus Crum & Anders. Fig. 106: 6-9 On tree trunks, rotten logs or sometimes on rock.
	NF to ONNF to ON, south to NC, TN and MI.
89.	Stems and branches covered with long, branched, white, yellow, or green paraphyllia giving them a cobwebby
	appearance; stems often frondose, 1-3 pinnate
	HYLOCOMIUM
	A. Stems regularly branched, 2-3 pinnate; stem leaves usually with a long, slender,
	undulate acumen
	On humus, rotten logs, soil and rocks in swamps
	and forests. NF to MBGR to AK, south to NC, GA, TN, MI, IA, SD, CO, ID and CA.
	A. Stems irregularly branched, 1-2 pinnate; stem
	leaves broadly acuminate and not undulate
	NF to ONLB to ON, south in the mountains and northern states to NC, TN and MI; also in AK and BC.
	northern states to no, in and mi, also in and box
89.	Stems and branches lacking paraphyllia90
	90. Plants julaceous
91.	Plants pinnately branched92
91.	Plants irregularly branched94
	92. Plants small, stem leaves acuminate, seldom
	up to 1 mm long
	On soil and humus banks, bases of trees and boulders
	in moist woods. NF to ONLB to ON, south to NY and MI; in the West from AT to YT, south to MT and OR.
	92. Plants robust, stem leaves apiculate, often
	1 mm long or more93
93	Stems and branches orange or red
, J •	Pleurozium schreberi (Brid.) Mitt. Fig. 108: 6-10 (Red-Stemmed Feather Moss)
	On humus and soil in woods, occasionally in bogs,

	sometimes occurring on stumps. NF to MBGR to AK, south to NC, TN, AR, SD, CO, ID and OR.
93.	Stems and branches yellow or green
	94. Plants large, stem leaves often 1 mm long
95.	Leaves often short to long-acuminate, contorted when dry, stems often visible between leaves; on soil or humus over rock, sometimes over bases of trees and rotten wood
	PLAGIOTHECIUM
	A. Plants julaceous to complanate, leaves concave, symmetric, the apices often recurved; capsules erect, often striate when dry
	A. Plants complanate, leaves flat, asymmetric, the apices not recurved; capsules erect or inclined, smooth or striate when dry
	B. Leaf margins recurved; capsules inclined, striate when dry
	B. Leaf margins plane; capsules erect, rarely inclined, smooth
95.	Leaves acute to apiculate, scarcely contorted when dry, stems not visible between leaves; on bases of trees and rotten wood, rarely on rock
	96. Leaves about as broad as long, often ending in

spinose; on calcareous rock......Myurella

a short, hair-like apiculus, margins sometimes

MYURELLA

A. Plants julaceous, leaves close, imbricate, apiculate or sometimes obtuse, margins entire or nearly so
A. Plants not or rarely somewhat julaceous, leaves distant, spreading, acuminate, margins often spinulose
96. Leaves longer than broad, acute to obtuse, margins entire; on wood or noncalcareous rock
97. Plants complanate
98. Leaves strongly undulate; setae short, capsules immersed; occurring on tree trunks
99. Leaf apices broad and rounded
100. Stems and branches orange or red
100. Stems and branches yellow or green101
101. Leaves asymmetric
102. Leaves acuminate; occurring on soil over calcareous rock, sometimes on bases of trees or rotten wood

	Taxiphyllum deplanatum (Bruch & Schimp. ex Sull.) Fleisch. Fig. 114: 5-8 Usually on wet, calcareous rock bluffs, sometimes on bases of deciduous trees and rotten wood. NB, QU, ON, MBNB to SA, south to NC, TN and AR; also in AL, LA, NM and AZ.
	102. Leaves acute or rarely acuminate; on rotten wood and bases of trees, occasionally occurring on soil or rock
103. 103.	Leaves plicate to striolate
	104. Plants irregularly branched, leaves striolate when dry
	104. Plants pinnately branched, leaves plicate
105.	Plants plumose, stems and branches yellow or green, leaves falcate-secund, long-acuminate
105.	Plants sparsely pinnate, stems and branches orange or red, leaves erect or some squarrose
	RHYTIDIADELPHUS
	A. Stem leaves smooth, strongly squarrose to squarrose-recurved
	A. Stem leaves plicate, not or weakly squarrose
	B. Leaves rugose near apex, noticeably crowded near stem apices; costae strong, extending to middle of leaves or above

	B. Leaves neither rugose nor noticeably crowded at stem apices; costae lacking or weak and ending below middle of leaves
	106. Leaves squarrose
107.	Plants subpinnately branched, stems and branches orange or red
	108. Leaves large, often 2 mm or more in length, strongly twisted when dry; plants of wet habitats, such as fens and swamps
	Leaves mostly less than 1 mm long, ovate to cordate; capsules smooth
	Leaves usually 1 mm long or more, oblong-lanceolate to ovate; capsules striate
	HERZOGIELLA
	A. Leaves close, squarrose to squarrose- recurved
	MI, IL and MN; also in SA, AT, MT and SD. 110. Leaves falcate-secund, the apices turned
	toward the substrate

HYPNUM

	A. Stems pinnately branched; sporophytes
	often presentB
	A. Stems irregularly branched; sporophytes rare
	B. Plants large, stems and branches often
	1 mm wide of more, stems usually reddish
	Hypnum imponens Hedw. Fig. 118: 1-5
	Frequently on rotten logs and stumps in woods,
	sometimes on humus, soil and soil over
	boulders. NF to ON-LB to ON, south to
	GA, AL and AR.
	B. Plants small, stems and branches mostly
	less than 1 mm wide, stems green
	Hypnum pallescens (Hedw.) P. Beauv. Fig. 118: 6-10
	On bases of deciduous and coniferous trees,
	decaying wood, especially logs and stumps,
	and boulders in woods. NF to MBNF to BC,
	south in the mountains and northern states
	to GA, TN, MI, WI, MN and MT; also in LA and AZ.
	C. Leaves close and imbricate, concave, the
	stems and branches somewhat julaceous
	Hypnum cupressiforme Hedw. Fig. 119: 1-5
	On calcareous boulders and cliffs, sometimes on
	bases of trees, mainly in dry, exposed places.
	NF to MBLB to AK, south to NC, TN, AR, MN, NE,
	CO, AZ and WA.
	C. Leaves were Matent, complements to weekly
	C. Leaves more distant, complanate to weakly
	concave, stems and branches not julaceous
	On humus, rocks, and wet soil in roadside
	ditches, meadows, beside lakes and in swampy
	places. NF to MBGR to AK, south to FL, AL,
	MS, LA, TX, NM, ID and WA.
	ind, mi, in, in and with
	110. Leaves straight or somewhat curved111
111	Stone and branches comowhat flattened leaves south
TIT.	Stems and branches somewhat flattened, leaves acute to short-acuminate, alar cells often coloured orange
	or brown; capsules inclined and curved; on rotten
	wood, sometimes on bases of trees, soil or rockCallicladium haldanianum
	Callicladium haldanianum (Grev.) Crum Fig. 120: 1-5
	Commonly on rotten logs and stumps but occasionally on
	bases of trees, rock and soil. NF to MBNF to MB, south
	to NC, IN and LA; also in BC, AZ and CA.
	,
111.	Stems and branches not flattened, leaves
	long-acuminate, alar cells not coloured; capsules
	erect and straight; on tree trunks
	Pylaisiella polyantha (Hedw.) Grout Fig. 120: 6-9
	Usually on deciduous tree trunks, occasionally on rotten
	stumps and rocks. NF, NB, NS, QU, ON, MBLB to AK,
	south to NC, MI, IA, NE, NM and AZ.

pallescens. 6. Habit (x4). 7. Portion of stem and branches (x18). 8. Stem leaf

(x36). 9. Branch leaves (x36). 10. Capsule, dry (x18).

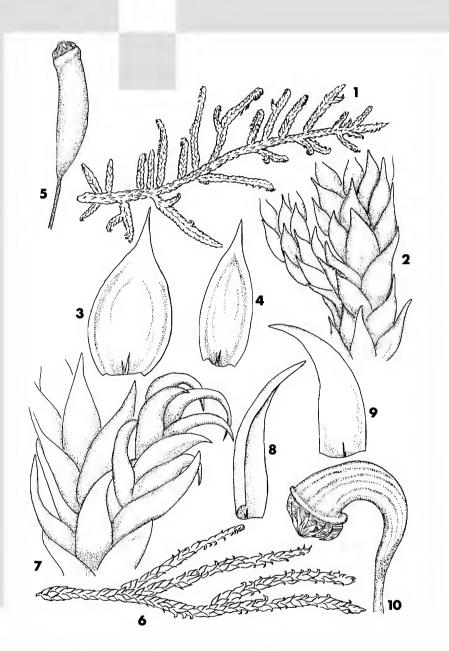

FIGURE 119. 1-5, Hypnum cupressiforme. 1. Habit (x2). 2. Portion of stem and branch (x18). 3. Stem leaf (x36). 4. Branch leaf (x36). 5. Capsule, dry (x18). 6-10, Hypnum lindbergii. 6. Habit (x2). 7. Portion of stem and branch (x18). 8. Stem leaf (x18). 9. Branch leaf (x18). 10. Capsule, dry (x18).

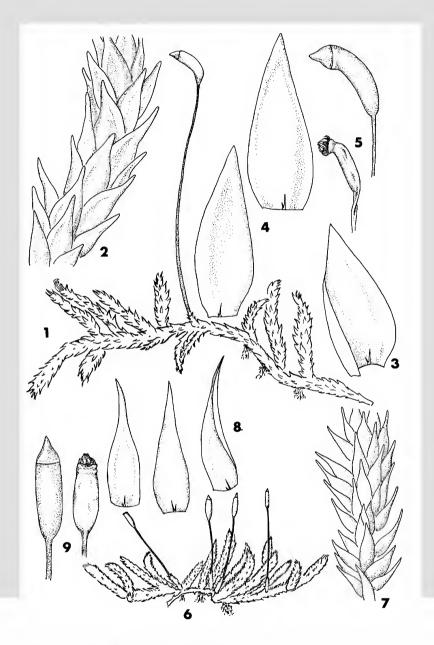

FIGURE 120. 1-5, Callicaldium haldanianum. 1. Habit (x4). 2. Portion of branch (x18). 3. Stem leaf (x36). 4. Branch leaves (x36). 5. Capsules, operculate (wet) and inoperculate (dry) (x9). 6-9, Pylaisiella polyantha. 6. Habit (x4). 7. Portion of branch (x18). 8. Branch leaves (x36). 9. Capsules, operculate (wet) and inoperculate (dry) (x18).

```
Acrocarpous -- mosses possessing erect, simple or sparsely branched gametophytes that
    grow in tufts and produce sporophytes at the end of a stem or main branch (e.g.,
    Tetraphis).
Acumen -- a slender, tapering point.
Acuminate -- slenderly tapered. (Fig. 121: 1)
Acute -- sharply pointed (less than 90°). (Fig. 121: 2)
Alar Cells -- cells at the basal angles of a leaf, often differentiated in shape,
    size or colour. (Fig. 121: 18)
Amphigastria -- a row of rudimentary leaves on the ventral side of the stem;
    underleaves. (Fig. 128: 100)
Annulus -- a ring of differentiated cells between the mouth of the capsule and the
    operculum, aiding in dehiscence. (Fig. 126: 73)
Antheridium (pl. Antheridia) -- the male reproductive organ, a globose to cylindric,
    stalked structure producing sperms. (Fig. 126: 70)
Antheridiophore -- the elevated male structure of certain thalloid liverworts, consisting
    of a disk and stalk arising from the thallus. (Fig. 127: 90)
Apiculate -- abruptly short-pointed. (Fig. 121: 4)
Apiculus -- a short, abrupt point. (Fig. 121: 4)
Appressed -- lying close together; closely applied to the stem. (Fig. 124: 50)
Archegonium (pl. Archegonia) -- the female reproductive organ, a flask-shaped
    structure producing an egg. (Fig. 126: 72)
Archegoniophore -- the elevated female structure of certain thalloid liverworts,
    bearing groups of archegonia. (Fig. 127: 91)
Arcuate -- curved like a bow. (Fig. 126: 78)
Asexual -- involving no sexual action; also possessing neither male nor female organs.
Asymmetric -- not symmetrical.
Attenuate -- narrowly tapered. (Fig. 124: 49)
Auriculate -- with small, ear-like bulges or lobes (auricles) at the basal margins of
    a leaf. (Fig. 121: 19)
Awn -- a bristle- or hair-point, usually formed by an excurrent costa. (Fig. 121: 3)
Axil -- the upper angle between leaf and stem. (Fig. 122: 26)
Bi- -- a prefix meaning two.
Biflagellate -- with two flagella.
Bilobed -- with two lobes. (Fig. 129: 104)
```

```
Bipinnate -- twice-pinnately branched. (Fig. 124: 56)
Bisexual -- having both sexes present.
Border -- margin differentiated from the rest of the leaf in colour or thickness.
    (Fig. 121: 22)
Bracts -- modified leaves around the reproductive organs; in liverworts, often larger,
    below the perianth. (Fig. 129: 113)
Bulbiform -- bulb-shaped. (Fig. 124: 57)
Caducous -- deciduous, regularly falling off.
Calcareous -- containing calcium carbonate (e.g., limestone or dolomite rocks).
Calyptra (pl. Calyptrae) -- a membranous hood over the young sporophyte, developed from
    tissue at the base of the archegonium; in mosses ruptured near the base, carried
    upward by elongation of the seta, and continuing growth to form a cap over the
    capsule (Fig. 126: 75-77); in liverworts splitting at elongation of the sporophyte
    and remaining at its base. (Fig. 129: 113)
Capsule -- the spore case; in mosses often differentiated into an upper spore-bearing
    \underline{urn} and a sterile basal portion called the \underline{neck} (Fig. 126: 73), undifferentiated
    in hornworts (Fig. 127: 94) and liverworts (Fig. 129: 113).
Cilia (sing. Cilium) -- delicate, hair-like appendages fringing leaves. (Fig. 121: 23)
Ciliate -- fringed with hairy appendages (cilia). (Fig. 121: 23)
Columella -- the central axis of a capsule around which the spores develop. (Fig. 127: 94).
Complanate -- flattened together or compressed in one plane. (Fig. 125: 61)
Complicate-Bilobed -- leaves bilobed, with lobes folded together. (Fig. 129: 109)
Connivent -- with the tips converging, or coming close together. (Fig. 129: 106)
Contorted -- bent into irregular curves, irregularly twisted. (Fig. 122: 32)
Cordate -- heart-shaped. (fig. 121: 12)
Costa (pl. Costae) -- a thickened region of usually elongate cells, either single or
    double in mosses, single in some thalloid liverworts; midrib. (Fig. 121: 22)
Costate -- with a costa.
Crisped -- irregularly curled and twisted. (Fig. 122: 32)
Cucullate -- hooded or hood-shaped; a cucullate calyptra is conic and split up one
    side, resembling a monk's hood (Fig. 126: 75); also used to describe leaves concave
    at the tips. (Fig. 121: 11)
Decurrent -- with the margins extending down the stem below the leaf insertion as
    ridges or narrow wings. (Fig. 122: 27)
Dendroid -- branched above a trunk-like base and resembling a tree. (Fig. 124: 58)
```

Dentate -- with sharp teeth directed outward. (Fig. 123: 40)

```
Dichotomous -- equally forked, with paired branches. (Fig. 124: 60)
Distichous -- in two opposite rows. (Fig. 124: 54)
Dorsal -- the back or lower surface (i.e., the surface away from the stem) or the upper
    surface (i.e., the surface away from the substratum) of a flattened plant body like
    a thallus. (Fig. 122: 26; 128: 96, 101)
Dorsal Lobe -- the lobe on the upper surface of a plant. (Fig. 129: 109)
Doubly Serrate -- with teeth overlapping and joined in pairs. (Fig. 123: 42)
E- -- a prefix, meaning not, without.
Ecostate -- without a costa. (Fig. 121: 23)
Elaters -- small, unicellular, sterile cells, usually elongated and with spiral
    thickenings, mixed with the spores in the capsules of liverworts; aiding in spore
    dispersal. (Fig. 129: 107)
Elliptic -- essentially oblong but convex at sides and ends. (Fig. 121: 20)
Entire -- not at all indented or toothed; with a continuous margin. (Fig. 123: 39)
Eperistomate -- without a peristome.
Erect-Spreading -- spreading at an angle of about 45° or less. (Fig. 123: 44)
Excurrent -- extending beyond the apex or end of lamina. (Fig. 121: 3)
Exserted -- projecting and exposed, applied to capsules which project beyond the tips
    of the leaves. (Fig. 127: 88)
Falcate -- curved like the blade of a sickle. (Fig. 122: 34)
Falcate-Secund -- strongly curved and turned to one side. (Fig. 124: 53)
Fascicle -- a small bundle or cluster. (Fig. 125: 64)
Female Bracts -- modified leaves, often larger, below the perianth; also called
    perichaetial bracts. (Fig. 129: 113)
Filiform -- slender and elongate, filamentous, thread-like.
Flagella (sing. Flagellum) -- whip-like slender branches or stems, leafless or with
    rudimentary leaves, e.g., <u>Bazzania</u> (Fig. 128: 100); long, whip-like structures
    controlling the movement of the sperm cell.
Flexuose -- slightly and irregularly bent, twisted, or wavy. (Fig. 122: 33)
Foot -- the basal absorbing organ of the sporophyte. (Fig. 126: 73)
Frondose -- closely and regularly branched in one plane.
Gametophyte -- the dominant, sexual generation which bears the sex organs; the green,
    leafy or thalloid plant. (Fig. 128: 95-96)
Gemma (pl. Gemmae) -- a small, asexually produced reproductive body, formed of
    1-several cells. (Fig. 125: 66; 129: 112)
```

Gemmae Cup -- small cup-like structure, formed from modified leaves, leafy tissue or thalloid tissue, that contains gemmae. (Fig. 125: 65; 128: 97)

Gemmae Receptacle -- a container with gemmae inside. (Fig. 128: 98)

Gemmiferous -- bearing gemmae.

Globose -- spherical. (Fig. 126: 83)

Hispid -- with short, stiff hairs, bristly. (Fig. 126: 76)

Hyaline -- colourless and transparent.

Hygrophytic -- indicating a plant occurring in wet habitats but not in water.

Imbricate -- closely overlapping. (Fig. 124: 51)

Immersed -- completely covered; immersed capsules are exceeded by the tips of leaves.
 (Fig. 127: 89)

Inclined Capsule -- less than vertical, between erect and horizontal. (Fig. 126: 79)

Incubous -- leaves of liverworts that are obliquely inserted so the lower leaf overlaps
 the one above it when viewed from the dorsal surface and toward the stem apex.
 (Fig. 128: 101)

Inflated - swollen.

Inflorescence -- a cluster of sex organs and the leaves surrounding them.

Inoperculate -- without operculum.

Involucre -- a short tube or sheath, sometimes formed by an outgrowth of the thallus, forming a protective covering around the archegonia and sporophyte. (Fig. 129: 113)

Julaceous -- smoothly cylindric, like a worm, referring to stems or branches with crowded and imbricate leaves. (Fig. 124: 52)

Keel -- the projecting ridge on the fold of some leaves. (Fig. 122: 29; 129: 109)

Lamellae (sing. Lamella) -- ridges or plates on the costa or lamina of some moss leaves. (Fig. 122: 38)

Lamina (pl. Laminae) -- the expanded part of a leaf or thallus (as distinguished from the costa). (Fig. 121: 22)

Lanceolate -- lance-shaped, narrow and tapered from the base (narrower than <u>ovate</u>). Fig. 121: 16)

Lateral -- on or at the side.

Ligulate -- strap-shaped (longer and narrower than lingulate). (Fig. 121: 13)

Linear -- very narrow and elongate, with nearly parallel sides (narrower than ligulate). (Fig. 121: 14)

```
Lingulate -- tongue-shaped, oblong with a broadened apex. (Fig. 121: 15)
Mesic -- moist, neither very wet nor very dry but intermediate.
Micrometer -- one-thousandth of a millimeter.
Microphyllous Branchlets -- small branches with reduced leaves, serving as asexual
    reproductive bodies. (Fig. 125: 67)
Mitrate -- conic and undivided or equally lobed at base, referring to calyptrae of
    mosses (opposed to cucullate or split on one side). (Fig. 126: 77)
Mucro -- a short, abrupt point. (Fig. 121: 6)
Mucronate -- ending abruptly in a short point usually caused by a shortly excurrent
    costa. (Fig. 121: 6)
Multicellular -- composed of more than one cell.
Multistratose -- composed of more than one layer.
Neck -- the sterile basal portion of a capsule, sometimes considerably differentiated.
    (Fig. 126: 73)
Oblong -- much longer than broad, with nearly parallel sides. (Fig. 121: 24)
Obovate -- egg-shaped, with the broader portion at the apex rather than the base; the
    reverse of ovate. (Fig. 121: 25)
Obtuse -- blunt or rounded. (Fig. 121: 8)
Ocelli -- modified leaf cells in some liverworts, often glistening or discoloured,
    sometimes in groups or lines. (Fig. 129: 110)
Operculate -- with operculum.
Operculum (pl. Opercula) -- the lid covering the mouth of a moss capsule, falling at
    maturity to release the spores. (Fig. 126: 73)
Oval -- broadly elliptic in outline. (Fig. 121: 17)
Ovate -- egg-shaped in outline (with the base broader than the apex). (Fig. 121: 21)
Ovoid -- an egg-shaped solid. (Fig. 126: 82)
Paraphyllia (sing. Paraphyllium) -- small, filiform, lanceolate, or leaf-like, sometimes
    branched structures, with a white, yellow, green or rarely brown colour and often
    cobwebby appearance on stems and branches of some mosses. (Fig. 125: 68)
Paraphyses (sing. Paraphysis) -- hyaline or yellowish, multicellular hairs, sometimes
    club-shaped, mingled with the antheridia (and often with archegonia). (Fig. 126: 71)
Pendulous -- somewhat drooping, more inclined than horizontal. (Fig. 126: 80)
Percurrent -- extending to the apex. (Fig. 121: 5)
```

- Perianth -- a tubular sheath formed of 2-3 leaves that surrounds the archegonia and sporophyte. (Fig. 129: 113)
- Perichaetia (sing. Perichaetium) -- female inflorescences, comprised of leaves surrounding the archegonia.
- Perichaetial Leaves -- the leaves surrounding the archegonia.
- Peristome -- a single or double circle of teeth inside the mouth of the capsule of mosses; aiding in spore dispersal. (Fig. 126: 74)
- Peristomate -- with a peristome.
- Pinnate -- with numerous, spreading branches on two sides of the axis and thus resembling a feather. (Fig. 124: 55)
- Plane -- flat.
- Pleurocarpous -- mosses possessing prostrate, freely branched gametophytes that grow in mats and produce sporophytes laterally from the main stem (e.g., Hylocomium).
- Plicate -- folded in longitudinal pleats. (Fig. 122: 35)
- Plumose -- closely and regularly pinnate, feathery. (Fig. 125: 62)
- Postical -- below or behind; pertaining to the under (rhizoid-bearing) surface of a stem or the lower margin of a leaf.
- Prostrate -- creeping.
- **Protonema** (pl. Protonemata) -- green, branched filaments produced on germination of spores and giving rise to a leafy or thallose gametophyte.
- Pseudoelaters -- small, 2-5 celled, sterile structures mixed with the spores in the capsules of hornworts; aiding in spore dispersal. (Fig. 129: 108)
- Pseudopodium (pl. Pseudopodia) -- an elongation of a stem tip bearing clusters of gemmae. (Fig. 125: 66)
- Pyriform -- pear-shaped. (Fig. 126: 81)
- Reflexed -- bent backward. (Fig. 122: 31)
- Retuse -- slightly indented at a broad apex. (Fig. 121: 9)
- Rhizoids -- filamentous, unicellular (hornworts and liverworts) or multicellular (mosses) structures, dead at maturity, occurring on the gametophyte and anchoring it to the substratum. (Fig. 124: 58-59)
- Rib -- a longitudinal ridge on capsules or other organs. (Fig. 127: 84)
- Rosette -- circular (rose-like) arrangement of leaves. (Fig. 124: 59)
- Rugose -- with irregular transverse wrinkles or undulations. (Fig. 122: 36)
- Scales -- flat, blade-like, ventral appendages on gametophytes of thalloid liverworts.
 (Fig. 128: 99)

Secondary Stem -- branches arising from the main or primary stem. Secund -- turned to one side. Sessile -- without a stalk or seta. Serrate -- saw-toothed, with marginal teeth pointing forward. (Fig. 123: 41) Seta (pl. Setae) -- the stalk supporting the capsule. (Fig. 126: 73; 129: 113) Sheathing -- surrounding and clasping the stem or base of the seta. (Fig. 122: 28) Simple -- applied to structures, organs or plants that are unbranched. Sinus -- the indentation between lobes of a leaf. (Fig. 129: 104) Spinose -- spiny, with sharp, slender teeth or projections. (Fig. 123: 43) Spinulose -- minutely spiny. Spores -- minute, mostly spherical, nearly always unicellular bodies, produced in the capsule, that on germination form a gametophyte. Sporophyte -- the spore-bearing generation; the spore-bearing plant, produced by the fertilization of an egg, remaining attached to the gametophyte and partially dependent on it, typically consisting of foot, seta and capsule. (Fig. 126: 73) Spreading -- at an angle of 45° or more. (Fig. 123: 45) Squarrose -- spreading at right angles. (Fig. 123: 47) Squarrose-Recurved -- spreading at right angles, with the tips curved downward. (Fig. 123: 48) Stoloniferous -- plants that bear slender, creeping, usually minutely leaved stems and branches, often with rhizoids near the tips. (Fig. 125: 63) Striate -- marked with fine, longitudinal ridges. (Fig. 127: 86) Striolate -- finely ridged. Struma -- a goiter-like swelling on one side of the base of a capsule of some mosses. (Fig. 127: 87) Strumose -- bearing a struma. (Fig. 127: 87) Sub- -- a prefix meaning nearly, almost, somewhat, as in subglobose, subpercurrent, or subpinnate; also used to mean under, as subterranean. Substratum -- the surface to which the plant is attached. Subulate -- slenderly long-acuminate, shaped like a needle. (Fig. 121: 7) Succubous -- leaves of liverworts that are obliquely inserted so the upper leaf overlaps the one below it when viewed from the dorsal surface and toward the stem apex. (Fig. 128: 102) Sulcate -- grooved or furrowed. (Fig. 127: 85) Symmetric -- capable of division by one or more planes forming similar halves.

Terete -- rounded in cross-section, cylindric. (Fig. 124: 52)

Thalloid -- of, relating to, resembling or consisting of a thallus.

Thallus (pl. Thalli) -- a plant body that is flat, not much differentiated, and cordate or ribbon-like. (Fig. 128: 96)

Tomentose -- densely woolly, covered with rhizoids. (Fig. 125: 69)

Tooth -- a division of the peristome (Fig. 126: 74); also applied to irregularities or projections at the margins of leaves. (Fig. 123: 43)

Transverse -- leaves of liverworts that are inserted at right angles to the line of the stem. (Fig. 128: 103)

Tri- -- a prefix meaning thrice.

Tridentate -- with three dentations. (Fig. 129: 105)

Truncate -- abruptly cut off or squared off at the apex. (Fig. 121: 10)

Tubulose -- tube-like, usually referring to leaves with strongly incurved margins. (Fig. 122: 30)

Underleaves -- the leaves of the single row on the postical side of the stem of liverworts; amphigastria. (Fig. 128: 100)

Undulate -- wavy. (Fig. 122: 37)

Unicellular -- composed of one cell.

Unistratose -- composed of one layer.

Urn -- the spore bearing portion of a capsule. (Fig. 126: 73)

Valve -- one of the divisions into which the capsule of hornworts, most liverworts and the moss Andreaea separates when the spores are ready to be shed. (Fig. 127:92-94)

Ventral -- the front or upper surface (i.e., the surface toward the stem) of a leaf, or the lower surface (i.e., the surface toward the substratum) of a flattened plant body like a thallus. (Fig. 122: 26; 128: 99-100)

Ventral Lobe -- the lobe on the lower surface of the plant. (Fig. 129: 109)

Vitta -- a central band of one or more rows of glistening, elongated and thickened cells of certain liverworts, e.g., Diplophyllum. (Fig. 129: 111)

Wide-Spreading -- spreading at an angle but less than 90°. (Fig. 123: 46)

Xerophytic -- referring to a plant adapted to a dry habitat.

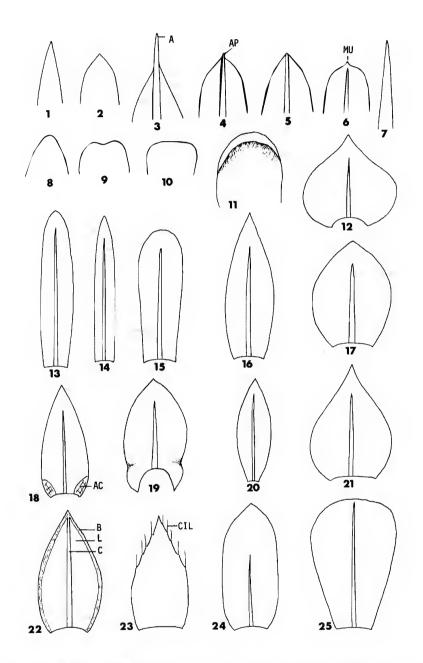

FIGURE 121. 1. Acuminate. 2. Acute. 3. Excurrent (A - awn). 4. Apiculate (AP - apiculus). 5. Percurrent. 6. Mucronate (MU - mucro). 7. Subulate. 8. Obtuse. 9. Retuse. 10. Truncate. 11. Cucullate. 12. Cordate. 13. Ligulate. 14. Linear. 15. Lingulate. 16. Lanceolate. 17. Oval. 18. Alar cells (AC). 19. Auriculate. 20. Elliptic. 21. Ovate. 22. Border (B - border; C - costa; L - lamina). 23. Ciliate, Ecostate (CIL - cilium). 24. Oblong. 25. Obovate.
