Resumo

Myxomycetes do estado de Alagoas (Brasil) e notas sobre sua distribuição. O estado de Alagoas, localizado na Região Nordeste do Brasil, abrange uma área de 27.767 km² onde diferentes ecossistemas, incluindo manguezal e Floresta Atlântica na costa e caatinga no interior, são encontrados. A literatura relata a ocorrência de 43 espécies de Myxomycetes no estado, as quais foram registradas em ambientes florestais úmidos ou em bagaço de cana de açúcar armazenado em indústria. Este estudo é o primeiro a registrar espécies de Didymiaceae e os gêneros *Badhamia*, *Comatricha*, *Perichaena*, *Reticularia* e *Stemonaria* para Alagoas. É apresentada uma chave para espécies. *Licea succulenticola*, *Reticularia jurana* e *Stemonaria longa* são novas referências para o bioma Caatinga. *Licea succulenticola* é registrada pela primeira vez no Brasil.

Palavras-chave: Caatinga; Corologia; Floresta Atlântica; Mixobiota

Abstract

The state of Alagoas is located in the northeastern region of Brazil, and covers an area of 27,767 km². Several different ecosystem types exist in this area, including mangroves forests and Atlantic rainforest on the coast, and Caatinga inland. The literature reports the occurrence of 43 species of Myxomycetes in Alagoas, all of which are recorded in humid forest environments, or in stored sugarcane bagasse. This study is the first one to record members of family Didymiaceae, and the genera *Badhamia*, *Comatricha*, *Perichaena*, *Reticularia* and *Stemonaria* in Alagoas. A species key is presented. *Licea succulenticola*, *Reticularia jurana* and *Stemonaria longa* are new references for the Caatinga biome. *Licea succulenticola* is also reported for the first time in Brazil.

Key words: Atlantic Forest; Caatinga; Corology; Myxobiota

Introduction

Studies of Myxomycetes are scarce in the state of Alagoas (northeastern Brazil). The first records of occurrence were all from stored sugar cane bagasse (CAVALCANTI et al., 1985; SANTOS et al., 1986; SANTOS; CAVALCANTI, 1988). Sporadic sampling has been carried out on small farms within the state, which resulted in the first report of *Echinostelium arboreum* Keller & Brooks in Brazil (CAVALCANTI, 2002). After exploring four fragments of the ‘Serra Grande’ sugarcane mill (in the municipalities of Ibateguara and São José da Lage), Cavalcanti et al. (2006) were the first to describe the occurrence of another 38 Myxomycetes species in the Atlantic rainforest, increasing the number of known species in the state to 43. In the present study, notes on the distribution of some of those species are presented, as well as new species records for the Caatinga biome and for Brazil.

Material and Methods

The state of Alagoas covers 0.5% of the total area of Brazil, and 2.87% of the northeastern region – with a total area of 27,767 km². It borders Pernambuco state in the North (8°48'12"S), Sergipe in the South (10°29'12"S), Bahia in the Southwest (35°09'36"S), and the Atlantic Ocean in the East (38°13'54"S) (PEIXOTO; LIMA JUNIOR, 2006). The climate is tropical humid on the coast and semi-arid within the continent; the latter has annual precipitation between 500 and 600 mm, with scarce and poorly distributed rainfall and an intense period of drought. The average annual temperature is between 25 and 27°C in the warmer period, and 21°C in the cooler months (PLGBB, 1988). The vegetation types along the coast vary from plain mangroves to a thin strip of Atlantic Forest. Caatinga is the predominant vegetation inland, as well as across the state (PEIXOTO; LIMA JUNIOR, 2006), and has been highly modified due to agricultural activities and the extraction of coal and firewood (SANTOS; TABARELLI, 2002).

We collected samples on a private farm located in the São José da Tapera municipality (9°32'42"S, 37°23'00"W), which is predominantly in the ‘Pão de Açúcar’ localization. Altitudes here vary between

220 and 255 m, representing typical landscape for semi-arid regions. Local vegetation consists of hyperxerophilous shrub-arboreal caatinga vegetation. The climate is semi-arid tropical, with the rainy season occurring from November to April and with an average annual precipitation of 431.8 mm (CPRM, 2005). We investigated potential microhabitats for Myxomycete sporulation, such as rotting wood and species of Cactaceae, Agavaceae and Bromeliaceae (Figure 1). A list of Myxomycetes species occurring in the state of Alagoas was compiled using the literature (CAVALCANTI et al., 1985; 2006; SANTOS et al., 1986; SANTOS; CAVALCANTI, 1988; CAVALCANTI, 2002; 2013a), herbarium material (UFP) and specimens collected in this study.

Dead litter of unidentified Bromeliaceae (35 mc), dead cladodes of three species of Cactaceae in the *Opuntia* (15 mc), *Cereus* (25 mc) and *Pilosocereus* (25 mc) genera were collected, stored in sterile plastic bags, and placed in moist culture chambers (100). These were moistened, and after 24 hours water pH was measured. Cultures were maintained for minimally three months (STEPHENSON et al., 1999).

Representative specimens were deposited at Herbaria URM and UFP (respectively at the Mycology and Botany Departments of the University Federal of Pernambuco, Brazil). Identification was based on Martin and Alexopoulos (1969), Farr (1976), Lado and Pando (1997), Mosquera et al. (2003), Martin et al. (1983); Lado (2013) was used for nomenclature and author abbreviations.

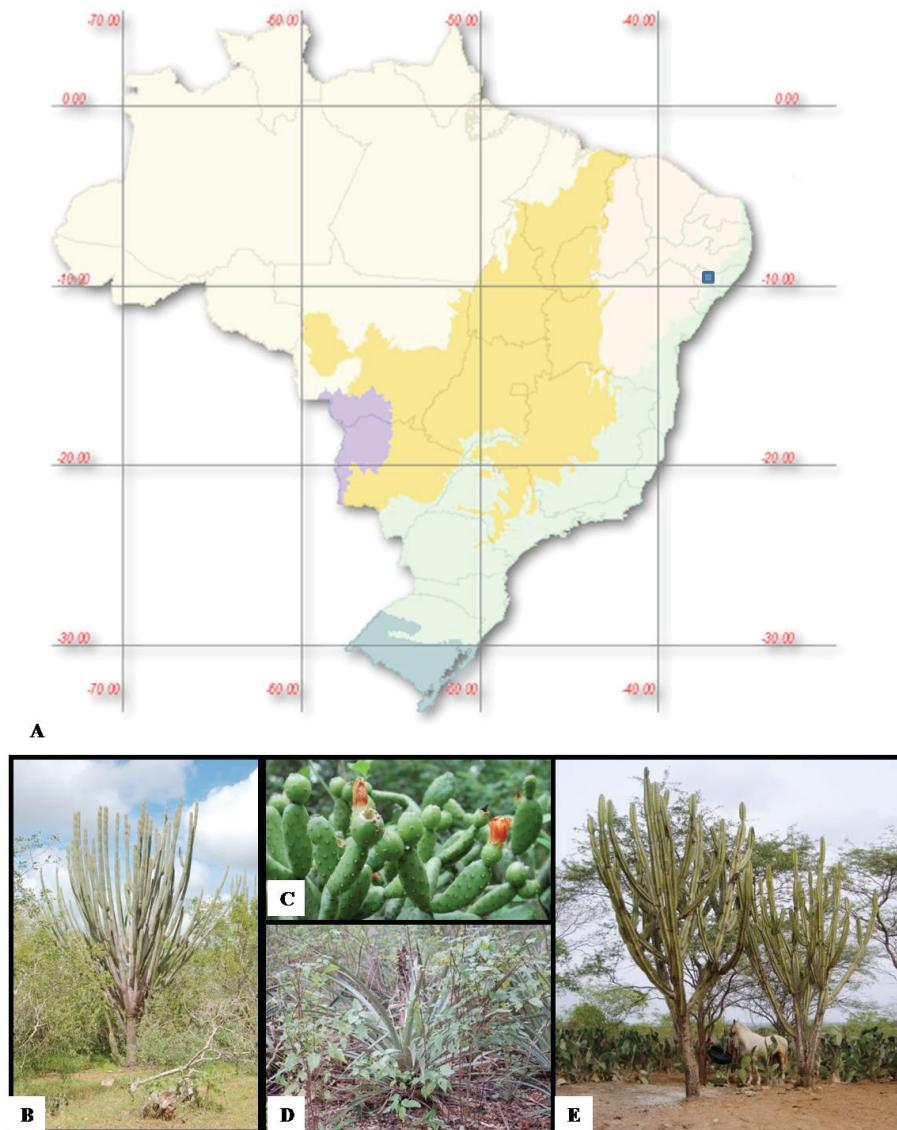

Results and Discussion

Arcyria cinerea (Bull.) Pers., Syn. Meth. Fung. 184 (1801)

Selected specimens. BRAZIL, Alagoas, municipality of São José da Tapera, *Pilosocereus* sp., cultivated 19 June, sporulating 08 July, leg. A.C.C. Bezerra (UFP 54,896). Ibidem, sporulating 17 July, leg. A.C.C. Bezerra (UFP 54,895). Ibidem, sporulating 04 Aug, leg. A.C.C. Bezerra (URM 80,042).

Recorded in Brazil in the northern (Acre, Amazonas, Pará, Roraima), northeastern (Alagoas, Bahia, Ceará,

FIGURE 1: A – Study area in the municipality of São José da Tapera (A – indicated with a blue square) and potential microhabitats for myxomycetes sporulation (B–E); B – *Pilosocereus pachycladus* Ritter.; C – *Opuntia inamoena* K. Schumann; D – *Bromelia* sp. E – *Cereus jamacaru* DC.

Paraíba, Pernambuco, Piauí, Rio Grande do Norte, Sergipe), southeastern (Minas Gerais, Rio de Janeiro, São Paulo) and southern (Paraná, Rio Grande do Sul, Santa Catarina) regions. Biomes: Amazonian, Caatinga, Cerrado and Atlantic rainforest (CAVALCANTI, 2013a).

Badhamia melanospora Speg., Anales Soc. Ci. Argent. 10:150 (1880). Figure 2.

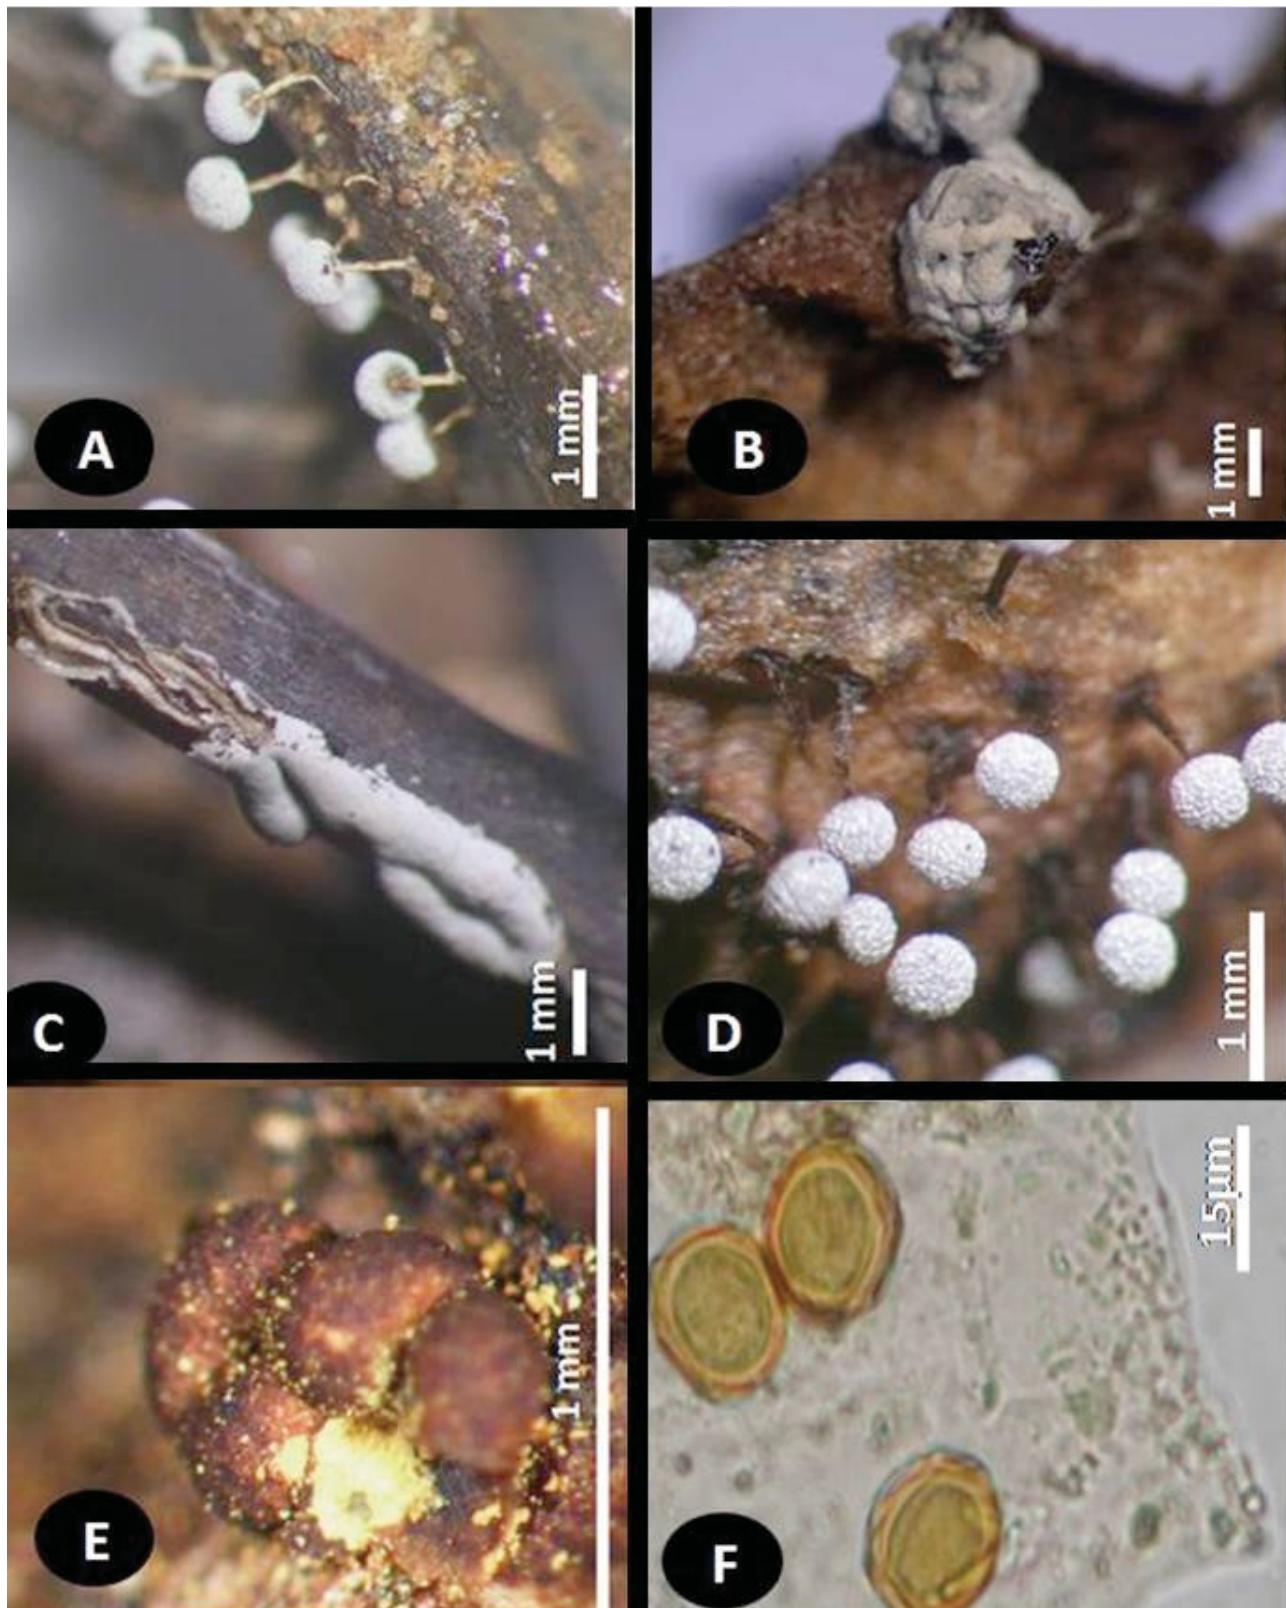

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, on wood, 17 June, leg. A.C.C. Bezerra (UFP 80,046).

Recorded in Brazil in the northeastern (Ceará, Pernambuco, Rio Grande do Norte), and southern (Rio Grande do Sul) regions. This is the first report of this genus in Alagoas state. Biomes: Caatinga and Atlantic rainforest (CAVALCANTI, 2013a).

Cribaria violacea Rex, Proc. Acad. Nat. Sci. Philadelphia 43:393 (1891)

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, *Opuntia* sp., cultivated 19 June, sporulating 17 July, leg. A.C.C. Bezerra (URM 80,047).

FIGURE 2: A – *Badhamia melanospora* Speg.; B – *Physarum compressum* Alb. & Schwein; C – *Didymium aff. dubium* Rostaf.; D – *Physarum pusillum* (Berk. & M.A.Curtis) G.Lister; E – *Perichaena corticalis* (Batsch) Rostaf.; F – Spores of *Licea succulenticola* Mosquera, Lado, Estrada & Beltrán-Tej.

Recorded in Brazil in the northeastern (Alagoas, Bahia, Paraíba, Pernambuco, Piauí, Rio Grande do Norte, Sergipe), southeastern (São Paulo) and southern (Santa Catarina) regions. Biomes: Caatinga and Atlantic rainforest (CAVALCANTI, 2013a).

Comatricha laxa Rostaf., Sluzowce Monogr. 201 (1874)

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, *Opuntia* sp., cultivated 19 June, sporulating 17 July, leg. A.C.C. Bezerra (URM 80,039).

Recorded in Brazil in the northeastern (Pernambuco, Piauí, Sergipe), southeastern (São Paulo) and southern (Santa Catarina) regions and in the Atlantic rainforest biome (CAVALCANTI, 2013a). This is the first report of this genus in Alagoas state.

Didymium aff. dubium Rostaf., Sluzowce Monogr. 152 (1874). Figure 2

Selected specimens. BRAZIL, Alagoas, municipality of São José da Tapera, *Opuntia* sp., cultivated 19 June, sporulating 15 July, leg. A.C.C. Bezerra (UFP 54,898; 54,899). Ibidem, sporulating 25 July, leg. A.C.C. Bezerra (URM 80,040; 80,041). Ibidem, sporulating 04 Aug, leg. A.C.C. Bezerra (UFP 54,900; UFP 54,897). Ibidem, sporulating 11 Aug, leg. A.C.C. Bezerra (UFP 54,901).

Members of the family Didymiaceae are reported for the first time in Alagoas state. Biome: Cerrado (CAVALCANTI, 2013a).

Hemitrichia calyculata (Speg.) M.L. Farr, Mycologia 66(5):887 (1974)

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, on wood, 17 June, leg. A.C.C. Bezerra (UFP 54,894).

Recorded in Brazil in the northern (Acre, Amazonas, Pará, Roraima), northeastern (Alagoas, Bahia, Ceará, Paraíba, Pernambuco, Piauí, Rio Grande do Norte, Sergipe), southeast (Minas Gerais, Rio de Janeiro, São Paulo) and southern (Paraná, Rio Grande do Sul, Santa Catarina) regions and in the Amazonian, Caatinga, Cerrado and Atlantic rainforest biomes (CAVALCANTI, 2013a).

Licea succulenticola Mosquera, Lado, Estrada & Beltrán-Tej., in Mosquera, Lado, Estrada-Torres,

Beltrán-Tejera & Wrigley de Basanta, Anales Jard. Bot. Madrid 60(1):4 (2003)

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, *Opuntia* sp., cultivated 19 June, sporulation August 4, leg. A.C.C. Bezerra (URM 80,048). Recorded for the first time in Brazil.

Perichaena corticalis (Batsch) Rostaf., Sluzowce Monogr. 293 (1875). Figure 2

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, *Opuntia* sp., cultivated 19 June, sporulated 04 Aug, leg. A.C.C. Bezerra (UFP 54,900).

Recorded in Brazil in the northeastern region (Paraíba, Pernambuco), in the Caatinga, Cerrado and Atlantic rainforest biomes (CAVALCANTI, 2013a).

Physarum compressum Alb. & Schwein., Consp. Fung. Lusat. 97 (1805)

Selected specimens. BRAZIL, Alagoas, municipality of São José da Tapera, *Pilosocereus* sp., cultivated 19 June, sporulated 25 June, leg. A.C.C. Bezerra (UFP 54,902; UFP 54,905). Ibidem, sporulated 29 June, leg. A.C.C. Bezerra (UFP 54,904). Ibidem, sporulated 04 Aug, leg. A.C.C. Bezerra (UFP 54,906). Ibidem, sporulated 09 Aug, leg. A.C.C. Bezerra (UFP 54,903). Ibidem, sporulated 09 Sept, leg. A.C.C. Bezerra (URM 80,049).

Recorded in Brazil in the northeastern (Alagoas, Bahia, Ceará, Maranhão, Pernambuco, Sergipe), southeastern (São Paulo) and southern (Paraná, Rio Grande do Sul, Santa Catarina) regions in the Caatinga and Atlantic rainforest biomes (CAVALCANTI, 2013a).

Physarum pusillum (Berk. & M.A.Curtis) G.Lister, in Lister, Monogr. Myctozoa, ed. 2 64 (1911) (Figure 2).

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, on wood, 17 June, leg. A.C.C. Bezerra (URM 80,046).

Recorded in Brazil in the northern (Acre, Amazonas, Pará, Roraima), northeastern (Bahia, Paraíba, Pernambuco, Piauí, Sergipe), midwestern (Goiás) and southeastern (São Paulo) regions. Although commonly found in Brazil, this is the first record of this species in

Alagoas state. Biomes: Caatinga, Cerrado and Atlantic rainforest (CAVALCANTI, 2013a).

Reticularia jurana Meyl., Bull. Soc. Vaud. Sci. Nat. 44:297 (1908)

Selected specimen. BRAZIL, Alagoas, municipality of São José da Tapera, on wood, 17 June, leg. A.C.C. Bezerra (URM 80,044).

Recorded in Brazil in the northeastern (Alagoas, Paraíba, Pernambuco, Sergipe) and southeastern (São Paulo) regions in atlantic rainforest biome (CAVALCANTI, 2013a). This is the first report of this genus in Caatinga biome

Stemonaria longa (Peck) Nann.-Bremek., R.Sharma & Y.Yamam., in Nannenga-Bremekamp, Yamamoto & Sharma, Proc. Kon. Ned. Akad. Wetensch., C. 87(4):453 (1984)

Selected specimens. BRAZIL, Alagoas, municipality of São José da Tapera, on wood, cultivated 17 June, sporulated 04 Aug, leg. Bezerra A.C.C. (UFP 54,902; URM 80,045).

Recorded in Brazil in the northern (Amazonas, Roraima), northeastern (Bahia, Ceará, Paraíba, Pernambuco, Piauí), southeastern (Rio de Janeiro, São Paulo) and southern (Santa Catarina) regions. Biomes: Amazonian and Atlantic rainforest (CAVALCANTI, 2013a). This is the first report of this genus in Alagoas state, and in the Caatinga biome.

Notes on species

Didymium dubium has been reported from all of the continents except Africa. In the Neotropical region it has been cited in Argentina, Brazil, Colombia, Costa Rica, Dominican Republic, Ecuador, Guatemala, Mexico and Venezuela (LADO; WRIGLEY DE BASANTA, 2008; BEZERRA et al., 2008; LADO et al., 2013). This species is known as a nivicolous species, and is usually found between 2,000 and 4,000 m above sea level (FARR, 1976; LADO, 2004; LADO et al., 2005). The specimen recorded by Bezerra et al. (2008) sporulated on the leaves of *Vellozia squamata* Pohl. in a Cerrado area (210 m altitude), in the Serra de Itabaiana National

Park, Sergipe state (adjacent to Alagoas). Our specimen is differentiated from that found by Bezerra et al. (2008) by several features: the capillitium has dichotomously branched threads that do not form a network, the spores are more pale, and the ornamentation is more delicate, consisting of tiny warts. Lister (1925) commented that the spores of *D. dubium* can either be nearly smooth, or may have small spines. Martin and Alexopoulos (1969) and Farr (1976) reported a thickening at the base of the sporocarp resembling a columella; this characteristic has never been mentioned in any other *Didymium* species and was not observed in our study material.

Licea succulenticola is commonly found on specimens of Cactaceae [*Austrocylindropuntia exaltata* (A. Berger) Backeb, *Copiapoa* sp., *Myrtillocactus geometrizans* Console, *Opuntia ficus-indica* L., *Opuntia streptacantha* Lem., *O. tomentosa* Salm-Dyck and *Stenocereus* sp.], Euphorbiaceae (*Euphorbia canariensis* L.), Agavaceae (*Agave* sp., *Agave americana* L. *A. atrovirens* Karw., *Aeonium* sp., *Yucca filifera* Hort. ex Engelm.) and Rusaceae (*Nolina* sp.) (MOSQUERA et al., 2003; LADO et al., 2007). The species is known to occur in Chile, Ecuador, Spain (Canary Islands), the United States and Mexico (MOSQUERA et al., 2003; MCHUGH, 2005; LADO et al., 2007).

Perichaena includes 31 species worldwide (LADO, 2013), but only five are known to occur in Brazil (CAVALCANTI, 2013b); this is the first record of this genus in Alagoas state. In the northeastern region, *P. corticalis* has been cited in the highlands of Paraíba state, and in urban gardens in Pernambuco state (CAVALCANTI, 2002). Cavalcanti (1974) mentioned that this species frequently occurs in Pernambuco, and undergoes a long period of sporulation – from March to September/October. Despite the numerous sporocarps usually found in this species, only one sporocarp was found in the specimen collected in Alagoas, which was co-occurring with *D. dubium*.

Reticularia Bull. is comprised of eleven species reported throughout the world (LADO, 2013), but only two, *R. jurana* Meyl. and *R. lycoperdon* Bull., have been reported in Brazil. In the northeastern region, this genus was recorded exclusively in Atlantic forest areas in Alagoas, Bahia, Paraíba, Pernambuco, Rio Grande

do Norte and Sergipe states (CAVALCANTI, 2013c). The two analyzed specimens represent old sporangia collected from a decomposing tree trunk.

The genus *Stemonaria* Nann-Bremek., Sharma & Y. Yamamoto was created in 1984 for Stemonitaceae species that did not fit into any genus, but which had several characteristics in common, including a hollow stipe (homogeneous or with longitudinal fibres) and the lack of a complete or partial peripheral capillitium network. The two species recorded in Brazil (*Stemonaria longa* and *S. irregularis*) were collected in different environments in Amazonas, Bahia, Ceará, Paraná, Pernambuco, Piauí, Rio de Janeiro, and São Paulo states (CAVALCANTI, 2013d).

Key to genera and species known to occur in Alagoas state. References: 1. Cavalcanti et al. (1985); 2. Santos et al. (1986); 3. Santos e Cavalcanti (1988); 4. Cavalcanti (2002); 5. Cavalcanti et al. (2006); 6. Cavalcanti (2013a; 2013b; 2013c; 2013d); 7. Results from this study.

 40a. Sporotheca deep red, fading to red-brown...*A. denudata* (L.) Wettst.^{5,6}
 40b. Sporotheca pale grey*A.cinerea* (Bull.) Pers.^{2,3,4,5,6,7}
 41a. Sporocarps up to 150 µm....*E. arboreum* H.W.Keller & T.E.Brooks^{4,6}
 41bSporocarps over 200 µm *E. minutum* de Bary^{4,6}
 42a. Peridium remaining as a system of longitudinal thickened bands *C. cancellata* (Batsch) Nann.-Bremek.^{5,6}
 42b. Peridium remaining as a peridial net 43
 43a. Sporotheca dark violet with a metallic shine *C. violacea* Rex^{5,6,7}
- 43b. Sporotheca yellow, orange-brown, yellow brown or dark brown 44
 44a. Threads of the peridial net sturdy, rounded, free or nearly free of dictydine granules, with rounded meshes on a line from base to apex *C. confusa* Nann.-Bremek. & Y.Yamam.^{5,6}
 44b. Peridial net connected by nodes with dictydine granules..... 45
 45a. Calyculus either absent or reduced to a small stellate collar*C. microcarpa* (Schrad.) Pers.^{5,6}
 45b. Calyculus usually present..... 46
 46a. Peridial net consisting of angular nodes with projections attached to the threads, usually with 5-8 threads connecting adjacent nodes.....*C. intricata* Schrad.^{5,6}
 46b. Peridial net with small, regular meshes and prominent, small, round, dark nodes connected by 3-6 threads.....*C. tenella* Schrad.^{5,6}

Acknowledgements

The authors acknowledge the National Council for Technological and Scientific Development (CNPq) for its financial support and productivity grant awarded to L. H. Cavalcanti (552615/05-6; 305967/2009-6; 301126/2005-4) and a post doc scholarship to A.C.C. Bezerra (PROTAX 150820/2008-9).
