Oligohaline

Cd

Location: Freshwater tributaries

General ID: Lacks true roots, but stems can grow up to 3 m long. Brittle, stiff leaves grow in whorls of 9 or 10. Whorls are denser toward the end of the stem. Leaves fork into linear, flat segments. Fine teeth grow on one side of the leaf margin.

Similar morphology: Eurasian watermilfoil

Fun facts:

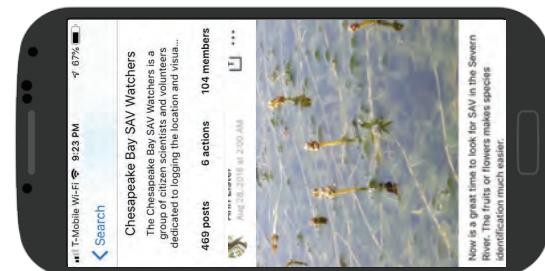

- Neither a dicot nor a eudicot, but is closely related to eudicots
- Found in all 50 states
- Most often found in slow-moving waters

Hornwort

Ceratophyllum demersum

Tier 1 monitoring parameters

Basic observer and site information

Photo required (if present)

SAV species

Now is a great time to look for SAV in the Severn River. The fruits or flowers make species identification much easier.

General ID: Lacks true roots, but stems can grow up to 3 m long. Brittle, stiff leaves grow in whorls of 9 or 10. Whorls are denser toward the end of the stem. Leaves fork into linear, flat segments. Fine teeth grow on one side of the leaf margin.

Similar morphology: Eurasian watermilfoil

Fun facts:

- Neither a dicot nor a eudicot, but is closely related to eudicots
- Found in all 50 states
- Most often found in slow-moving waters

Field packing list

Tier 1

On-site reporting

- Smartphone equipped with the Water Reporter app
- SAV species guide
- Paper
- Pencil
- Watch or Clock
- Camera
- GPS-enabled device
- Binoculars
- Hand lens

Optional items

- Dry bag
- Waterproof camera
- Mask and snorkel
- Boat
- Life jacket
- Trash bag

Tier 2

- Datasheets
- Pencils
- Dry erase marker
- Clipboard
- SAV species guide
- Pocket field guide
- Watch or clock
- Camera
- GPS-enabled device
- 8" Secchi disk with attached measuring tape
- Device to classify sediment
- First aid kit

Tier 2 monitoring parameters

Basic observer and site information

- Secchi depth
- Water depth
- Total SAV density
- Epiphytes
- SAV at surface
- Bottom sediment

Photo Required (if present)

- SAV species
- Other macrophytes
- SAV flowers and seeds

- Shoreline type
- Visible shoreline erosion
- Marine debris
- Other human impact

Oligohaline

Cd

Hornwort

Ceratophyllum demersum

Order Ceratophyllales • Family Ceratophyllaceae

Water starwort

Callitrichia sp.

Cal

Brazilian waterweed

Egeria densa

Egd

Location: Fresh waters throughout Bay

General ID: Egg-shaped leaves are bright green and about 2 cm long and up to 8 mm wide. Each joint of the stem has two leaves, which may float on or emerge above surface of the water.

Similar morphology: Common waterweed

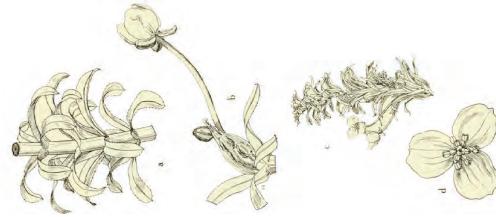

Fun facts:

- Multiple species occur in the Bay; *C. stagnalis* is shown at the left
- Provides habitat for insects
- Food source for ducks
- Food source for ducks

Eudicot • Order Callitrichales • Family Callichtrichaceae

8

Oligohaline

Location: Not common in the Bay; found in fresh waters

General ID: Forms thick mats at the surface of the water. Stems are highly branched. Leaves form in whorls of four and are densest near the top of the stem. Leaves are dark or bright green, serrated, long, and narrow (up to 2.5 cm long and 0.75 cm wide). Small white flowers form in the spring and the fall.

Similar morphology: Hydrilla, common waterweed

Fun facts:

- Native to South America
- Introduced to U.S. waters by aquarium owners emptying their aquaria in rivers and ponds

Monocot • Order Alismatales • Family Hydrocharitaceae

10

Oligohaline

Western waterweed

Elodea nuttallii

En

Ec

Common waterweed

Elodea canadensis

Ec

Location: Freshwater tributaries; occasionally in saltier waters where freshwater springs are found

General ID: Oval leaves grow directly on thin, branched stems (no leaf stalks). Leaves grow in whorls, with 3 per node. Tips of leaves are blunt and margins have fine teeth that are only visible using a hand lens. Leaves are densest toward stem tip.

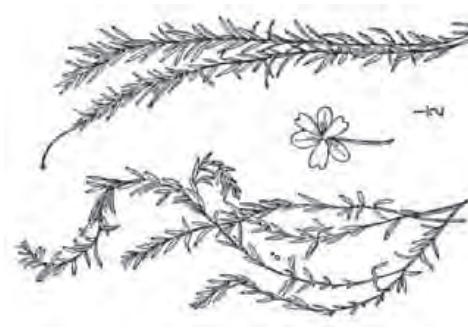

Similar morphology: Hydrilla, western and Brazilian waterweeds

Fun facts:

- Food for beavers, muskrats, and ducks
- Can grow in deep or shallow waters
- Habitat for invertebrates, small fishes, and amphibians

VATTENPLANT, ELODEA CANADENSIS L. C. RICHT.

Oligohaline

Location: Fresh waters and upper reaches of Bay tributaries

General ID: Long, slender, branched stems grow up to 1 m long. Whorled leaves grow directly on stems (in threes or fours) and are evenly spaced along stem. Leaves are short (up to 16 mm) and narrow. Leaves are pale green in color. Flowers are white.

Similar morphology: Hydrilla, common waterweed

Fun facts:

- Native to North America
- Invasive in Europe and Asia

Monocot • Order Alismatales • Family Hydrocharitaceae

Monocot • Order Alismatales • Family Hydrocharitaceae

Water stargrass

Heteranthera dubia

Location: Freshwater tributaries

General ID: Tall, somewhat bushy plant with grass-like leaves that grow on branching stems. The bottom of each leaf wraps around the stem like a sheath. Leaves are arranged alternately. Yellow, 6-petaled flowers may grow above water in the summer.

Similar morphology: Naiads

Fun facts:

- Flowers only open above the surface of the water
- There is also a terrestrial form of this species

Monocot • Order Commelinales • Family Pontederiaceae

16

Low watermilfoil

Myriophyllum humile

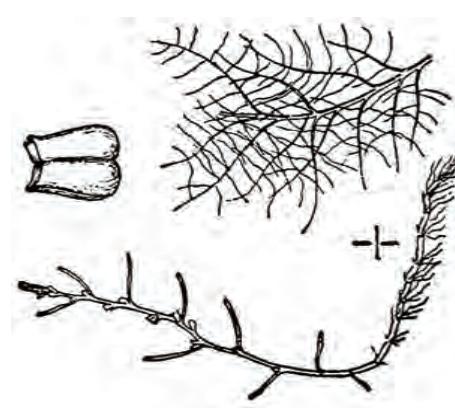

Location: Freshwater coastal ponds, lakes, and reservoirs along shoreline

General ID: Morphology is extremely variable depending on water level. Leaves are very fine and grow suboppositely or scattered along stems. Each leaf has up to 20 hair-like segments (up to 10 per side) that make this plant appear fuzzy.

Similar morphology: Eurasian watermilfoil

Fun facts:

- Not common in Chesapeake Bay

Monocot • Order Alismatales • Family Hydrocharitaceae

18

Mh

Myriophyllum brasiliense (or *aquaticum*)

Location: Fresh waters of the Bay

General ID: Stems are stout, with leaves occurring in whorls of five. Each side of the leaf has up to 25 hair-like protrusions that give it a feather-like appearance. Stems sometimes appear reddish.

Similar morphology: Eurasian watermilfoil

Fun facts:

- Can grow out of water and onto land
- No male plants exist outside of South America
- Native to the Amazon
- Introduced to the U.S. in Washington, D.C.

Hd

Hydrilla
Hydrilla verticillata

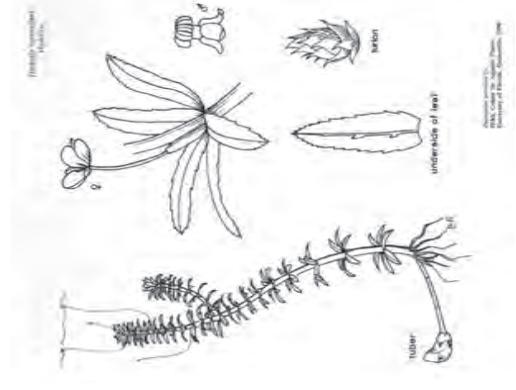

Location: Fresh and brackish waters of the Bay, in areas with muddy substrate

General ID: Stems are long and branching. Leaves grow in whorls of 3-5, and can be straight, lance shaped, or very small. Leaves are linear and serrated. Flowers are white and very small.

Similar morphology: Common waterweed

Fun facts:

- Non-native in the Chesapeake Bay
- Can live in lower light conditions than other SAV species
- Food source for migratory birds

Monocot • Order Alismatales • Family Hydrocharitaceae

18

Ma

Myriophyllum brasiliense (or *aquaticum*)

Location: Fresh waters of the Bay

General ID: Stems are stout, with leaves occurring in whorls of five. Each side of the leaf has up to 25 hair-like protrusions that give it a feather-like appearance. Stems sometimes appear reddish.

Similar morphology: Eurasian watermilfoil

Fun facts:

- Can grow out of water and onto land
- No male plants exist outside of South America
- Native to the Amazon
- Introduced to the U.S. in Washington, D.C.

Low watermilfoil

Myriophyllum humile

Eudicot • Order Saxifragales • Family Haloragaceae

Eurasian watermilfoil

Myriophyllum spicatum

Location: Widely distributed in fresh and brackish waters of the Bay and its tributaries

General ID: Delicate leaves resemble feathers and grow in whorls of 4 (usually) or 5. Leaves are pinnate and lose their shape when removed from the water. In the summer, reddish flowers grow in spikes above the water.

Similar morphology: Parrot feather milfoil, hornwort

Fun facts:

- Is an introduced species in the Bay
- Provides habitat for insects and aquatic species

Eudicot • Order Saxifragales • Family Haloragaceae
24

Oligohaline Mesohaline

Nfl

Northern naiad

Najas flexilis

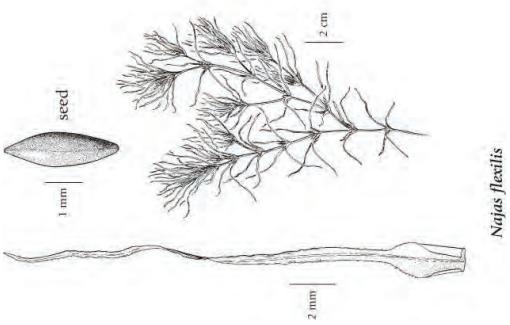

Location: Rivers and fresh and brackish Bay waters, in areas with sandy substrate

General ID: Narrow leaves are slightly broader at the base and grow up to 6 mm long. Leaves are opposite or in whorls, and curve out from the stem. Stem is slender and branching.

Similar morphology: Slender, southern, and spiny naiads

Fun facts:

- Also known as the "nodding water nymph"
- Sensitive to pollution
- Food source for water birds

Monocot • Order Alismatales • Family Hydrocharitaceae
26

Oligohaline

Ngd

Southern naiad

Najas guadalupensis

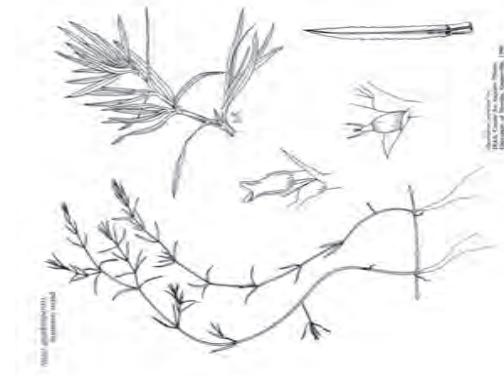

Location: Rivers and fresh and brackish Bay waters, in areas with sandy substrate

General ID: Narrow, flat, straight leaves grow up to 33 mm long. Leaves are opposite or whorled on slender, branching stems.

Similar morphology: Slender, northern, and spiny naiads

Fun facts:

- Found across the Americas
- Considered a weed in some areas
- Food source for water birds and fish
- Also called "bushy pondweed"

Monocot • Order Alismatales • Family Hydrocharitaceae
30

Oligohaline

Ngr

Slender naiad

Najas gracillima

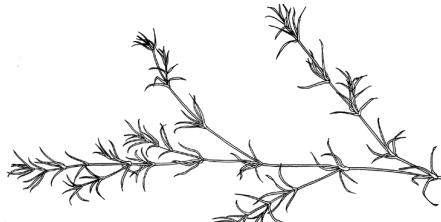

Location: Rivers and fresh and brackish Bay waters, in areas with sandy substrate

General ID: Leaves are narrower than those of southern and northern naiads. Tiny teeth are very difficult to see on leaf edges. Leaves are opposite or whorled and grow up to 28 mm in length. Leaves grow more densely near the top of the slender, branching stem.

Similar morphology: Northern, southern, and spiny naiads

Fun facts:

- Also called the "thread-like water nymph"

Nm

Spiny naiad

Najas minor

Location: Rivers and fresh and brackish Bay waters, in areas with sandy substrate

General ID: Leaves are narrower than those of Southern and Northern naiads. Tiny teeth on leaf edges are visible to the naked eye. Stiff, recurved leaves grow oppositely or whorled on slender, branching stems.

Similar morphology: Slender, southern, and northern naiad

Fun facts:

- Also called the "brittle water nymph"
- Introduced species from Europe

Monocot • Order Alismatales • Family Hydrocharitaceae
32

Pi

Leafy pondweed

Potamogeton epihydrus

Location: Slow moving, fresh waters less than 2 m deep

General ID: Has both floating and submerged leaves, which are bright green with a light-colored stripe down the center. Floating leaves are paddle-like. Stems are flat and grow up to 18 cm long. Flowers are small and brownish green.

Similar morphology: Other pondweeds

Fun facts:

- Eaten by waterfowl
- Provides habitat for aquatic animals

Monocot • Order Alismatales • Family Potamogetonaceae
36

Pc

Curly pondweed

Potamogeton crispus

Location: Widely distributed in fresh and slightly brackish waters of the Bay

General ID: Stems are flat and branching, with alternate or opposite leaves. Leaves are long and broad, with wavy edges and fine teeth. In the winter, leaves appear blue-green and flat; spring and summer leaves are curlier and reddish brown.

Similar morphology: Redhead grass

Fun facts:

- Introduced to the Chesapeake Bay in the 1800's
- Winter and summer forms look very different from one another
- Leaves appear crimped

Monocot • Order Alismatales • Family Potamogetonaceae
34

Pi

Illinois pondweed

Potamogeton illinoensis

Location: Rare in the Bay, may be found in freshwater areas

General ID: Long stems support ellipse-shaped leaves. Leaves grow submerged and floating. Submerged leaves are longer than floating ones, and have pointed tips. Floating leaves are paddle-like. Stems are long, cylindrical, slim, and branching. Small green flowers grow on spikes.

Similar morphology: Other pondweeds

Fun facts:

- Also known as "shining pondweed"

Monocot • Order Alismatales • Family Potamogetonaceae

Redhead grass

Potamogeton perfoliatus

Location: Rivers, ponds, and tidal fresh and brackish waters of the Bay

General ID: Floating leaves may appear dense at the surface. Stems can be up to 2 m long. Floating leaves are oval and are 10–18 cm long and up to 2–5 cm across. Underwater leaves are sparse, and are smaller and blade-like. Flower stalks grow above water.

Similar morphology: Other pondweeds

Fun facts:

- Also called "longleaf pondweed"
- Food source and shelter for turtles, fishes, ducks, and invertebrates
- Has submerged and floating leaves

Monocot • Order Alismatales • Family Potamogetonaceae

42

Mesohaline

Location: Brackish waters with muddy substrate and slow currents

General ID: Flat, oval leaves are arranged alternately or oppositely. Leaf bases attach directly to the stems. Leaves are up to 7 cm long and 4 cm across, and have curled edges. Stems may be whitish or reddish, and branched near the top.

Similar morphology: Curly pondweed

Fun facts:

- Named for the redhead ducks that consume it
- Also a food source for other waterfowl

Monocot • Order Alismatales • Family Potamogetonaceae

42

Rm

Widgeongrass

Ruppia maritima

Location: Upper and middle Bay and fresh to brackish tributaries

General ID: Long, thin, grass-like leaves have pointed tips and may be purplish in color. Leaves are arranged alternately and have prominent mid-veins. Stems are slender and branching. Flowers grow in whorls on spikes.

Similar morphology: Sago pondweed, horned pondweed, and widgeongrass

Fun facts:

- Also called "small pondweed"
- Eaten by waterfowl

Source: Crow and Heithaus © 2000

Oligohaline

Ppu

Slender pondweed

Potamogeton pusillus

Location: Widely distributed in Bay

General ID: Long, narrow, threadlike leaves grow alternately on narrow stems. A sheath grows at the base of each leaf. Leaves grow up to 10 cm long and 0.5 mm wide. During the late summer, flower stalks grow and branch upwards.

Similar morphology: Horned and sago pondweed (when not flowering)

- May be found growing with eelgrass
- Most common in sandy substrate
- Important food source for ducks, geese, and other waterfowl

American pondweed

Potamogeton nodosus

Location: Rivers, ponds, and tidal fresh and brackish waters of the Bay

General ID: Floating leaves may appear dense at the surface. Stems can be up to 2 m long. Floating leaves are oval and are 10–18 cm long and up to 2–5 cm across. Underwater leaves are sparse, and are smaller and blade-like. Flower stalks grow above water.

Similar morphology: Other pondweeds

Fun facts:

- Also called "longleaf pondweed"
- Food source and shelter for turtles, fishes, ducks, and invertebrates
- Has submerged and floating leaves

Bladderwort

Utricularia

Up

Location: Freshwater ponds and ditches with stems and leaves submerged. Stems are branching and grow horizontally. Leaves are alternate, stem-like, linear, and may grow oppositely or whorled. Bladders grow on stems and leaves. True roots are absent. Flowers grow on leafless stems when present.

Fun facts:

- Several species inhabit the Chesapeake Bay
- Are carnivorous; they trap and digest organisms in bladders
- Free-floating and rootless
- Often called "ditch grass"

Eudicot • Order Lamiales • Family Lentibulariaceae

50

Oligohaline

Sago pondweed

Stuckenia pectinata

50

Mesohaline

Monocot • Order Alismatales • Family Potamogetonaceae

48

Location: Fresh to brackish waters throughout the Bay

General ID: Stems are slender and branching. Leaves are arranged alternately, and are long, threadlike, and tapered to a point. The basal sheath may be pointed. Stems and leaves may appear fan-like.

Similar morphology: Horned pondweed and widgeongrass

Fun facts:

- This species was formerly classified as *Potamogeton pectinatus*
- Inhabits the Americas, Europe, Africa, and Asia
- Easiest to differentiate from widgeongrass when seeds are present

Va

Vallisneria americana

Zm

Zostera marina

Location: Salter waters of the Bay

General ID: Leaves are ribbon-like and alternate, spaced at nodes up to 3.5 cm apart. Leaves have rounded tips and are wrapped at the base by a sheath up to 20 cm long. Leaves can grow up to 1.2 m in length, and may be long and wide (deep, muddy areas) or short and narrow (shallow, sandy areas).

Similar morphology: Wild celery

Fun facts:

- Eelgrass beds provide refuge for many species including seahorses, pipefish, juvenile fishes, blue crabs, and scallops.
- Eelgrass is the only true seagrass found in the Chesapeake Bay.

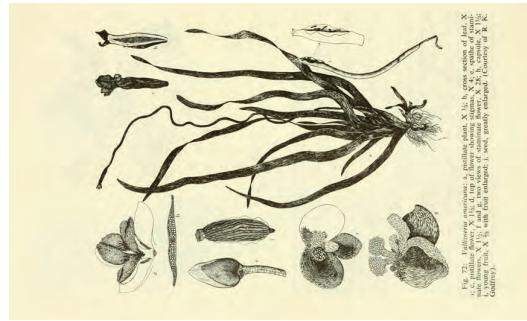

Fig. 72. Vallisneria americana L. Drawing of the plant showing flowering spike, X, a single node of the stem, Y, and a single fruit, Z, with the seed attached. The drawing is greatly enlarged. Courtesy of R. K. Godfrey.

Horned pondweed

Zannichellia palustris

Location: Widely distributed in the Bay

General ID: Stems are slender and branching. Long, linear, threadlike leaves are arranged oppositely or in whorls. Leaf tips are pointed and the basal sheath of the leaves is thin. This plant can be distinguished by its horn-like seeds that appear in pairs or sometimes in a set of four.

Similar morphology: Sago pondweed, wedgeon grass

Fun facts:

- Multiple variations of this species exist; several are shown on this page
- Two forms are found in the Bay: one grows upwards, the other grows along the bottom sediment with stems and roots together

Monocot • Order Alismatales • Family Potamogetonaceae

56

Zp

Epiphytes

58

What are they? Epiphytes are algal species that grow on SAV. In terrestrial systems, epiphytic plants may grow on other plants, such as trees.

Are they parasites? No. Epiphytes use SAV and other plants as a substrate on which to grow, and do not necessarily impact their host negatively. However, when nutrients are overly abundant, epiphytic algae may cover too much of the host SAV surface, blocking light and inhibiting photosynthesis.

Location: Often found growing on SAV in and around the Bay.

General ID: Varies immensely depending on species of epiphyte. May grow on stem or base of SAV.

Green freshwater algae

Genera: *Chara*, *Nitella*

Common Name: Muskgrass

General ID: Resemble some SAV species, but these are algae, not vascular plants. Leaves branch, and grow off branching stems in whorls.

Green freshwater macroalgae

Red saltwater macroalgae

Genera: *Gracilaria*, *Agardhiella*

Common Name: Red algae

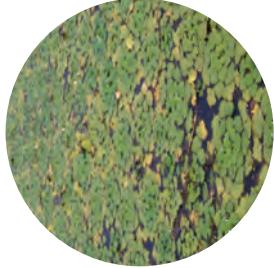

General ID: Red in color, highly branched structure.

Red saltwater macroalgae

62

Water chestnut

Trapa natans

What is it? Water chestnut is an invasive floating aquatic plant that is actively managed in the Chesapeake Bay.
Location: Has been found in upper Chesapeake Bay tributaries and in the Potomac River.

General ID: Triangle-shaped leaves form rosettes that float on the surface of the water. The plant itself is bulky but the flowers are small and white.

Impacts on SAV species: Leaves can block sunlight from reaching SAV, competes for space.

What to do if you see it: If you see water chestnut while sampling SAV, alert MD DNR at (410) 260-8630.

64

Note: Do not determine leaf arrangement based on where the stem divides, as this will likely reflect an atypical arrangement from the majority of the plant.

68

Harmful algal blooms

What is it? Certain algae species can produce toxins dangerous to humans and aquatic species. When these species reproduce very quickly, or "bloom", they can form a harmful algal bloom, or "HAB".

General ID: May look like thick mats or clumps are growing on or near the water surface. May be red, green, or brown in color.

What should you do? It is difficult to distinguish a harmful algal bloom from a non-harmful one, so it is best not to sample in areas with an algal bloom. Instead, report suspicious algal blooms to the Chesapeake Bay Safety and Environmental Hotline at (877) 224-7229.
